Bruce A. Miyahara
Secretary

*Includes Marriage and Divorce Statistics, 1991-1995

Center for Health Statistics, Vital Statistics report staff:

Sharon Estee, *Manager, Research Services, (360) 586-8729*

Patricia Starzyk, *Research Investigator - Births, (360) 586-6028*

Laura Harmon, *Computer Analyst/Programmer, (360) 664-2408*

Craig Parker, *State Nosologist - Deaths, (360) 586-6008*

Design Consultation:

Office of Health Promotion

Acknowledgements:

We gratefully acknowledge the contributions of the many individuals who participate in the reporting of vital statistics and the maintenance of these very important public health indicators. We thank physicians, hospital staff, midwives, funeral directors, coroners/medical examiners, local registrars, and all staff of the Center for Health Statistics. Most importantly, we appreciate the role families and individuals play by providing information about the very personal events of their daily lives to promote the health of the population of Washington State.

Elizabeth Ward

Assistant Secretary

Epidemiology, Health Statistics & Public Health Laboratories

Teresa J. Jennings

State Registrar and Director

Center for Health Statistics

- 241 52. Divorces and Annulments by Husband's Age and County of Decree, 1995
- 243 53. Divorces and Annulments by Number of Children and County of Wife's Residence, 1995

Introduction

Introduction

Washington State Vital Statistics, 1994 & 1995, published by the Center for Health Statistics of the Washington State Department of Health, contains tables on births and deaths that occurred during calendar years 1994 and 1995 and on marriages and dissolutions of marriages (i.e., divorces, annulments) occurring in 1991 through 1995.

This report fulfills an important mission of the Department of Health—to help Washingtonians live healthier lives by enabling them to make informed choices about behaviors affecting their health and by insuring their access to high quality health care and preventive services. Timely and wide-ranging health information, such as that presented in *Washington State Vital Statistics*, is crucial to accomplishing this mission. This report is often the first resource used to identify problems related to prenatal care, maternal and infant health, family planning, and mortality due to various causes.

Source of Vital Statistics

Data used to prepare this report come from Certificates of Live Birth, Certificates of Fetal Death, Certificates of Death, Certificates of Marriage, and Certificates of Dissolution. The forms for these certificates are provided by the Washington State Department of Health. The following table describes who completes the forms and where they are filed:

Filing of Washington State Vital Statistics

Certificate	Completed by	Initially Filed with
Live Birth	Hospital or Birth Attendant	State Dept. of Health
Fetal Death	Hospital or Birth Attendant	Local Health Jurisdiction
Death	Funeral Director, Physician, Coroner or Medical Examiner	Local Health Jurisdiction
Marriage	Person Performing the Marriage	County Auditor
Dissolution	Clerk of Court, Petitioner's Attorney	County Clerk

RCW 70.58 which governs the registration and reporting of vital statistics requires births, fetal deaths, deaths, marriages, and dissolutions of marriage to be reported within a timely fashion. Birth and death certificates are designed to gather information in a manner consistent

with federal reporting requirements of the National Center for Health Statistics.

A formal interstate exchange agreement governs the mutual exchange of information on births and deaths between states and other countries so that events occurring to Washington residents elsewhere are also reported to this state. Such an interstate exchange agreement does not exist, however, for marriages and divorces. Therefore, the Center for Health Statistics does not have the records for all of the state's residents since some may have gone elsewhere to be married or divorced.

Starting in 1992, hospitals or birth attendants use the Electronic Birth Certificate (EBC) system to send birth records directly to the Department of Health instead of to registrars of local health jurisdictions.

New Features of this Report

Birth Weight Categories

The allocation of birth weights into categories has been changed in preparing tables for this report to make them consistent with World Health Organization (WHO) guidelines. In particular, the birth weight of 2,500 grams has been shifted from the low birth weight category to the next higher weight category (i.e., 2,500-2,999). Other birth weight categories have been adjusted for consistency (e.g., the group that was 3,001-3,500 grams in earlier reports is now 3,000-3,499 grams). Because of the way birth weight has been measured in Washington State, the effect of this change on trend data is extremely small (see Technical Appendix A). Tables affected are: 2G, 3-5, 14, and 47.

Cause of Death Groupings

Causes of death are categorized according to an elaborate and highly detailed classification system developed by the World Health Organization as published in the *International Classification of Diseases, Ninth Revision (ICD-9)*. Due to the detailed nature of this classification system, it is common to group ICD-9 codes into more general categories for analysis and comparison purposes. The National Center for Health Statistics (NCHS) provides one of the most commonly used classification systems in which causes of deaths for adults are grouped into 72 separate groups and deaths for infants into 61 groups. In preparing the goals for Healthy People 2000 (HP 2000), the Centers for Disease Control and Prevention (CDC) focused on a different classification of adult deaths in several areas, as follows:

1. NCHS classifies diseases of the heart as ICD-9 codes 390-398, 402, 404-429; HP 2000 focuses only on ischemic heart disease which is based on ICD-9 codes 402, 410-414, 429.2;

2. NCHS classifies malignant neoplasms of trachea, bronchus and lung as ICD-9 162 in its entirety; HP 2000 focuses only on lung cancer which is a subset (ICD-9 codes 162.2-162.9);
3. NCHS includes deaths due to legal intervention with homicide (ICD-9 E960-E978); HP 2000 examines only homicides (ICD-9 E960-E969); and
4. NCHS uses accidental drowning and submersion (ICD-9 E910); HP 2000 includes additional codes to define drowning (ICD-9 E830, E832, E910).

The Washington State Center for Health Statistics, unfortunately, has not been using either of these national standards in grouping causes of death in prior annual summaries of vital statistics. Although closely modeled after NCHS's classification scheme, Washington State's tables in the past have deviated in slight ways in several of the cause of death categories. In preparing tables for this report, an attempt was made to correct this situation and to present cause of death groupings in such a way as to allow the user to compare statistics to both NCHS's classification scheme and to Healthy People 2000. A description of the changes is provided in Technical Appendix A.

Alcohol-Related Cause of Death Categories

In previous reports, alcohol-related deaths were incorrectly classified as any deaths from ICD-9 codes 291, 303, or 305. The code 305 actually includes other drugs such as tobacco and cocaine; only 305.0 pertains specifically to alcohol abuse. Including all of ICD 305 causes about a 25% overestimate of alcohol-related deaths. The category has been corrected in this report to include only ICD-9 codes 291, 303, and 305.0. The table affected is: 22.

Leading Causes of Infant Death

Along with a summary of leading causes of death for all deaths, this report also presents a summary of the ten leading causes of infant death in the state (Table 20F).

Historical Data

Birth and death data for 1980-1993 were recently updated with changes received after earlier reports were published. For this report, birth and death data for these years are based on these revised annual statistical datafiles and may not match numbers published in prior reports.

Marriage and Divorce Tables

For the first time since 1990, this report includes tables of data on marriages and divorces in Washington State. These data were not included in 1991-1993 reports because of data quality problems which

have since been resolved. To provide a complete series of marriage and divorce data, this report contains data tables for 1991-1995.

Baby Names List

For the first time ever, this report contains a list of the 100 most popular baby names for girls and boys born to Washington State residents in 1994 and 1995 (Appendix E).

Corrections for CD-ROM Users

In 1995, the Center for Health Statistics released a CD-ROM with 1980-1994 birth and death data files and annual summary tables (see 'Additional Services Available' at the end of this Introduction). A few corrections to the data have been made since the release of that CD-ROM. Therefore, readers are advised to use the 1994 tables in this report or those shown on the most recent version of the CD-ROM published in October 1996.

The annual summary tables in the most recent CD-ROM of vital statistics for 1980-1995 contain the following errors which have been corrected in this report:

1. Table 20E - Ranks of the leading causes of death were incorrect for 1994 and 1995 but were correct for 1980-1993 on the most recent CD-ROM.
2. Appendix D - The population estimate for the city of Renton is 44,890 in 1995 not 43,890 as shown on the CD-ROM; rates for this city are correct in this report and may differ slightly from those in the annual summary tables for 1995 on the CD-ROM.

Marriage and Divorce Data Reporting Issues

Residence vs. Occurrence Data

Marriages are tabulated in this report according to the county in which the marriage was performed. Divorces, annulments, and legal separations are tallied by county in which the legal certificate was issued. Thus, these statistics reflect the place of occurrence of the event (e.g., marriage ceremony performed, divorce decree issued) rather than the place of residence of the individuals involved. Information on the number of marriages or divorces for all residents of Washington State is not possible since residents may go elsewhere to have a marriage performed or to obtain a divorce. For marriage and divorce statistics, unlike other vital records such as births or deaths, there is no interstate agreement for the exchange of information on marriages and divorces for residents of Washington State that occur in other states.

Divorces and annulments issued in Washington State are tabulated by the wife's county of residence in one table in this report: Table 53 -

Divorces and Annulments by Number of Children and County of Wife's Residence. Thus, this table, unlike the others included in this report, presents information by place of residence rather than by the place at which the legal document was issued. As shown on this table, some of the women who had divorces or annulments issued in Washington State were from out of state.

Legal Separations

In previous reports, legal separations were included in divorce totals. Because legal separations are not final dissolutions of marriage, they have been excluded from divorce totals in this report beginning in 1992. This change makes Washington State consistent with national data published by the National Center for Health Statistics. The impact of the change on trend data is small, since legal separations equal only about one to two percent of total dissolutions.

In 1991, because of a temporary change in the automated information system, a large number of records did not have the type of decree recorded. As a result, it was not possible to distinguish legal separations from actual divorces. Therefore, in 1991 tables an estimated 300-400 legal separations were included in the count of divorces (about 1 percent of the total divorces).

Court Orders

Each year a small number of divorces (between 32 and 145) were submitted to the Center for Health Statistics by county clerks as court orders and the certificate of dissolution was not filed with the Center as required by law (RCW 70.58.055(3)). These court orders are not included in divorce totals reported here; the number of such court orders and the counties from which they came are shown in footnotes to the applicable tables.

Number of Children

Data on the number of children reported on the certificate of dissolution are captured by an item on the form labeled, "Children born alive of the marriage." Table 53 in this report presents the number of divorces and annulments tabulated by the number of children born to the couple regardless of the child's age (i.e., some of the children may be over 18 years of age). Data on the number of children are not available for 1992 and 1993 because of data collection problems in those years.

How To Use Vital Statistics

Why Read this Section?

Washington State Vital Statistics presents commonly used vital statistics data. These data not only have a variety of uses, but also a variety of users

ranging from the beginner to the sophisticated analyst. This section is intended primarily to help those who do not entirely understand how to use vital statistics data or are not aware of data limitations, especially limitations due to small numbers. Reading this section may help beginning users avoid drawing incorrect conclusions from the data. For other users, this section may serve as a review.

What Vital Statistics Can and Can't Do

Vital statistics pertain to basic events of life, typically birth, death, marriage, and divorce. They provide powerful indicators of health problems and, therefore, can help us to track progress toward health improvement goals. They can also provide information on what the health problem is, who has the problem, and when and where it occurs. Unfortunately, vital statistics cannot usually tell us why the problem occurs, which is what prevention programs really need to know. It is a common mistake to think that if two data items are associated or correlated (such as age of mother and low birth weight), then one causes the other. In reality, this could be a chance association (if you look at enough variables you find some relationship) or both items could be associated with a third, unmeasured factor (such as poverty or poor nutrition).

Mortality statistics are sometimes used as indicators of disease conditions within the population. They are very limited in this capacity, however, especially for illnesses that are not usually classified as the underlying cause of death. Hospital inpatient data from the Comprehensive Hospital Abstract Reporting System (CHARS) provide a somewhat better measure of morbidity, but even these data are limited to conditions that result in a hospital admission.

How to Use the Data

There are several questions the user should ask as a guide to extracting data from the tables in this report.

1. What's the difference between residence and occurrence?

In trying to locate topics of interest in this report, users may notice that tables contain tabulations in two ways: 1) by residence (where the person lived); or 2) by occurrence (where the event occurred). For example, a woman who lived in Olympia (Thurston County) but had her baby in Seattle (King County) would be counted in Thurston County on a residence table and in King County on an occurrence table. The Center for Health Statistics actually registers only those vital events occurring in Washington State. However, thanks to an interstate exchange agreement, we receive data on Washington residents having babies or dying in other states. Thus we have complete records on births and deaths for residents of Washington State regardless of where the event took place.

Some users may be tempted to add residence and occurrence figures together to get a total for an area, but this would not be correct. There is a great deal of overlap between these two, as most residents of a county also have their babies or die in the same county. Other users try to subtract residence and occurrence data to figure out how many residents are born or die outside of their county, but this is also incorrect. The only way to determine where county residents are having babies or dying is to tabulate births or deaths by place of residence relative to place of occurrence. For example, in Table 8 of this report the mother's county of residence is cross-tabulated by the county in which the birth occurred.

2. Do I want residence or occurrence data?

Users generally need data about the residents of an area. Residents would be the target audience for any local health assessment or health promotion programs. Population figures, commonly used to calculate rates, are also based on a person's residence. Hospital planners might want to know both (where births occurred to residents of their area) so they can assess possible markets.

For certain events, particularly external causes of death such as motor vehicle accidents or drowning, prevention programs might instead want to know where the event occurred so they can identify potentially hazardous situations or areas. Unfortunately, there is no population base to use for calculating occurrence rates, which might tell if the numbers are unusually high or low. For example, a rural road might have a high number of motor vehicle accidents relative to the number of people living there, but there may be many more people driving that road on their way to work, so there would be more people at risk of getting in accidents. The effect of a variable population always needs to be considered when looking at occurrence data. Occurrence rates published in this report use residence population figures, so they are less meaningful than residence rates.

The decision to use residence or occurrence data should be based on the type of data needed and the way they will be used, given the above discussion as a guideline.

3. Should I use numbers or rates?

All tables in this summary give the number of events (e.g., the number of Washington residents dying of cancer). These numbers are used to determine the size of a problem in any area (e.g., how many people die of cancer) or to estimate population changes due to birth and death. But, using just numbers, we cannot readily compare two areas or two time periods. Such comparisons should take the size of the population into account to avoid erroneous conclusions.

To eliminate the effect of different sized populations, we compare rates. A rate is the number of vital events (such as deaths) in a specified time period divided by the number of people at risk of these events in that

period (typically, a state or county population, or the number of births in the case of infant death). This figure is generally multiplied by a constant such as 1,000 or 100,000 to get a number that is easy to read and compare and is reported as 'per 1,000' or 'per 100,000.'

Rates calculated in this manner are called *crude rates*. They adjust for differences in population size but not differences in population characteristics. These population characteristics also need to be considered in interpreting comparisons. For example, since death rates increase with increasing age, a county with an older population may have higher death rates just because its population is older.

To compare rates and see if the county is high just because of its older population, we need to use *age-adjusted death rates*. These rates are computed by taking a county's death rates for each age group and applying them to a standard population (generally the 1940 U.S. population). This calculation then tells us what the county's death rate would be if it had the same age distribution as the U.S. population did in 1940. The major use of age-adjusted death rates is to allow comparisons between different areas and/or over various periods of time.

Users should be aware that an age-adjusted death rate has no absolute meaning; it is an artificial number based on a hypothetical population and is only useful for comparing with other rates calculated in the same manner. For more discussion of age-adjusted death rates, see the Center's report, *Washington State Age-Adjusted Death Rates and Years of Life Lost Rates* (April 1992). While age adjustment is the most common method for adjusting rates, a similar process can be used to adjust for other characteristics such as sex, education, or birth weight.

Analytical reports place great emphasis on which population has the highest rate, but it is important to remember that rates can mask substantial differences in numbers which may be needed for policy decisions. For example, the infant mortality rate for many people of color groups is considerably higher than the white rate. However, due to the racial composition of the state's population, most infants dying (84%) are white. While there are obviously good reasons for reducing infant mortality among people of color, policy makers need to be aware that this reduction may have very little effect on the overall state infant mortality rate. In determining the burden of a health problem in a community, numbers are usually the most appropriate measure.

4. What do I use for comparison of rates?

To help interpret a particular rate, one may choose to compare it to rates for another county or similar geographical area, national or state data, or an independent goal or standard (such as the Year 2000 goals). Such issues as comparability of the population characteristics and stability of

rates from year to year for the standard population should be considered when choosing a base for comparison.

No matter what source for comparison is chosen, users should always find out how the rates were calculated, to see if the same methods and definitions were used. Otherwise, the rates are not truly comparable and may lead to incorrect conclusions. Some questions to ask might be: Are the rates crude or adjusted? Are they for the same time period? Is the definition of what constitutes an event the same? Are the same coding definitions used? Is the completeness of reporting events similar? Are the denominators taken from the same or similar data sources?

5. What do I do about unknowns?

Most vital statistics data are not 100% complete. Sometimes the information is not (or cannot be) collected, and then the item is reported as unknown. When the number of unknowns for a particular characteristic is large, it can affect rates or percentage distributions based on that characteristic. For example, in 1994 father's education was missing for about 22% of the births.

How should unknowns be handled in calculating percentages? If we include unknowns in the total, the percent in any category is smaller than it would be if we subtract unknowns from the total. For example, in the case of 1994 births, the percent of fathers with less than a high school education is 10.1% if unknowns are included in the total, but the percentage is 12.9% if unknowns are excluded from the total.

In deciding which method offers a "truer" representation of the population as a whole one needs to consider whether the cases with an unknown characteristic are similar to or different from those cases in which the characteristic is known. If it appears likely that the cases with the unknown characteristic are similar to those with the known values, then "unknowns" should be excluded from the total and percentages should be based on the "known" population. To the extent that this assumption seems unlikely, then other methods could be invoked to distribute the cases with unknown values.

Assumptions about the probable characteristics of the population with a given unknown attribute could be based on: 1) greater familiarity with local situations by persons in the county or city health community; or 2) on more in-depth analysis of the source of the unknowns in the reporting system. For example, if only a few hospitals or medical facilities fail to report a particular variable, one might examine information about the population served by those particular facilities or those living in the nearby community.

6. What's all this I hear about the problem of small numbers?

If the state collects all births and deaths in a year, then aren't the birth and death rates exactly as calculated? It's certainly true that vital statistics are not based on samples of the population, as many research data are. We do know the actual number of births, deaths, and population (assuming complete reporting of events), so we can calculate an exact birth or death rate for any one year. However, the data may still be affected by random fluctuations in the number of events between successive measurements (e.g., for different years).

The effect of such random fluctuations on birth or death rates is proportionately larger when the number of events is small. For example, one more infant death has a larger numerical impact on an area with 3 deaths than it does on an area with 300 deaths. Because of these random fluctuations, the rates based on small numbers may not be as reliable as those based on larger numbers in the sense that they may have limited predictive value. Specifically, knowing one year's rate in such instances may not allow one to reliably anticipate the rate for another year. This instability makes it difficult to use the rates for program planning or assessment purposes. In fact, considerable caution should be used in interpreting any data where the number of events is small.

There are no hard and fast rules as to when numbers are too small for rates to be stable predictors of what's happening. However, the Public Health Improvement Plan (PHIP) guidelines call for suppressing calculation of rates when the number of events is less than 5. To increase the stability of the rate, one can combine several years of data (as long as there is no strong temporal trend in rates) or one can group several counties in the same geographic area or with similar population characteristics.

7. How does data quality affect the use of the data?

Conclusions and health policy decisions are only as good as the data that go into making them. Vital statistics data quality has three major components: completeness, accuracy, and timeliness. Are vital statistics *complete*, i.e., do we have a record for each vital event? According to National Center for Health Statistics (NCHS) studies, registration of births and deaths is currently better than 99% complete. Registration completeness may be slightly lower for births or infant deaths occurring outside of a hospital or for vital events among people of color. Also, some records come in after the data files are prepared and thus are not included in the data presented in this report.

In addition to determining the completeness of a reporting system, researchers are often concerned with the degree to which people report what is actually happening. This characteristic of the data is called its *validity*. Studies of validity of reporting systems like the birth certificate system usually look for an independent source of the information and

determine the consistency with data contained in the reporting system. A previous study of birth certificate data quality conducted by the Center for Health Statistics showed that validity of the item varied with the type of item. Legal information (e.g., names, addresses, ages) is very accurately reported. Unfortunately, medical information (e.g., menses date, prior pregnancy outcomes, complications, and malformations) is less accurate. Comparison to what was actually found in patients' medical history records revealed error rates of 5-20%.

To improve data quality, both birth and death certificates are edited for accuracy of the data. Where possible, data are checked to see if they are within a reasonable range of values (e.g., mother's age must be 8-59, with warning notices for ages less than 14 or greater than 49). Data are also checked to see if there is internal consistency between items (e.g., a person is not expected to have more than one year of college education if he/she is less than 16 years old). Those who complete death certificates are queried if there is not enough information to establish an accurate and specific cause of death.

A factor that affects the completeness of the data is the number of *unknowns* among responses. Sometimes providers do not complete all items on a certificate. The information may be overlooked or refused by the informant, or the informant may not have been asked for the data. Missing data decrease the overall accuracy of an item because we don't know where they fit (e.g., are smokers less likely to respond to a question on smoking?). Querying for missing data can help to provide more information. Also, the new Electronic Birth Certificate (EBC) system makes it more difficult to enter "unknown" into the record.

Finally, are vital statistics *timely*, i.e., are they registered early enough so that the data are available when needed to be most useful for planning and program assessment purposes? There is often a tradeoff between timeliness and accuracy. For example, if birth certificates are filed quickly, there may not be enough time for malformations or complications (such as fetal alcohol syndrome) to become evident. Similarly, if death certificates are filed quickly, there may not be time for autopsy results to be incorporated into the cause of death data. Despite the potential benefits of waiting for complete information, the main thrust--particularly for birth certificates--is to streamline the reporting process and to gather and report information as close to the event as possible. This has been accomplished by the Center for Health Statistics primarily by the development of the Electronic Birth Certificate System

8. How do we insure confidentiality of the data?

All of the data in this report are presented in aggregate form so that individuals are not likely to be identified from the tables. However, it is important for potential data users to be aware of confidentiality issues related to the data. The medical and health information on birth and fetal

death certificates is confidential and is to be used only in aggregate statistics which do not enable the identification of specific individuals. Hence, such confidential data may not be linked to any identifying information except for research projects approved by the Human Research Review Board of the Department of Social and Health Services and the Department of Health. The sample birth and fetal death certificates in Appendix F delineate the portion that is confidential. Some death data (particularly causes of death such as suicide and AIDS), while not confidential by law, are extremely sensitive.

It is the responsibility of all data users to treat these data in such a way as to respect and protect the privacy of individuals who have allowed information about their personal lives to be used for the good of the public. To ensure continued reporting of important demographic, medical, and health information, data must be handled in a way that ensures the privacy of individuals as required by law.

Additional Services Available

This annual report provides an overview of the types of data available through the Washington State Center for Health Statistics. Birth, death, and fetal death data are also available as raw data files on the Center's CD-ROM "*Vital Registration System Annual Statistical Files, Washington State.*" The CD-ROM contains data in ASCII format, detailed technical documentation, and annual summary tables for 1980-1995 in WORD, Wordperfect, and print text format. To order a copy of the CD-ROM, call (360) 664-2408.

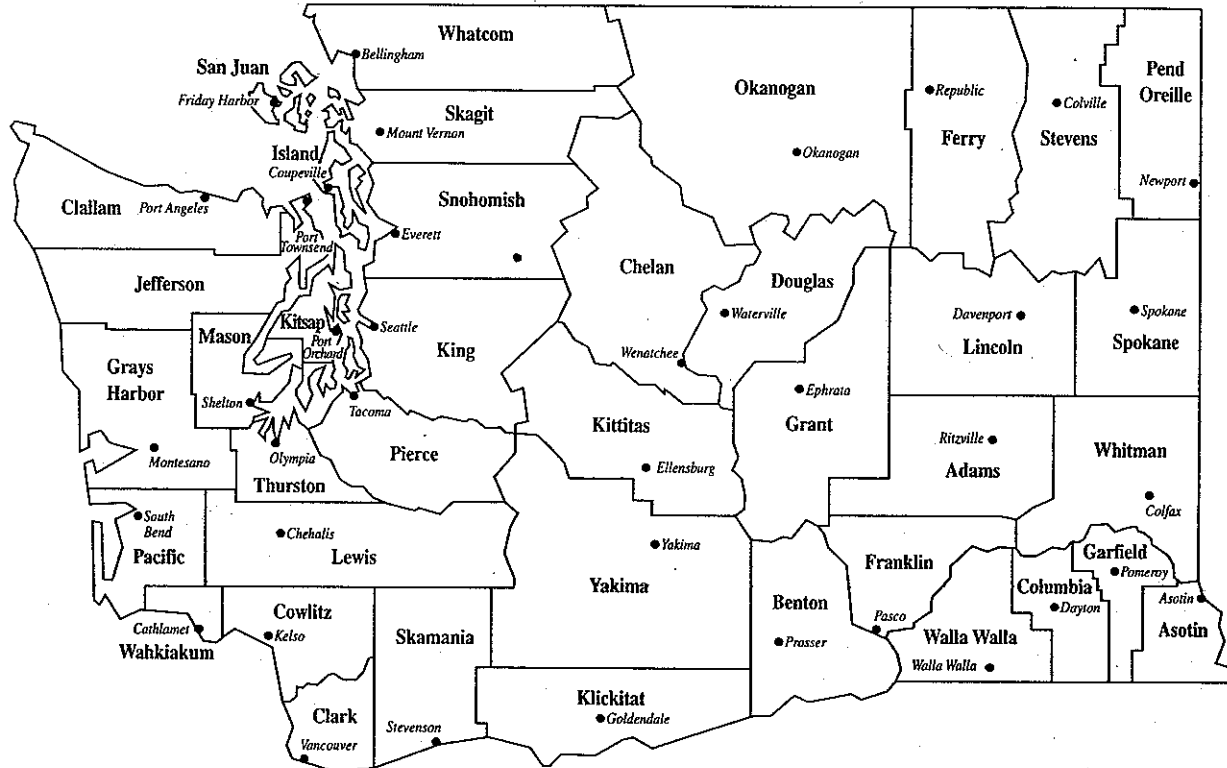

The Center also works with data users on a variety of levels: 1) to help users formulate requests so they get the data they need; 2) to provide technical consultation about how to use or interpret data; 3) to perform special analyses to address a specific problem or need; and 4) to help users access raw data files. For more information, call the Center's research line at (360) 753-5936.

Overview

Washington Counties and County Seats

Overview

The map of Washington State counties is provided to help users identify the location of counties used in tables in this report.

Table 1 provides a historical context for interpreting 1994 and 1995 vital statistics in Washington State. The 1995 crude birth rate was the lowest rate in twenty years. In contrast, the crude death rate has changed little since 1980.

Trends in vital statistics since the early part of the century have been dramatic. The state population more than quadrupled from 1910-1995, while the number of fetal deaths is about half what it was and the number of infant deaths is about one-quarter what it was early in the century.

Table 1. Vital Statistics for Washington State Residents, 1910-1995

Year	Population ¹	Live Births		Deaths		Infant Deaths		Maternal Deaths		Fetal Deaths

¹Population figures for 1910-1950 ten year intervals and for 1950-1994 single years are revised estimates provided by the Office of Financial Management, 1995 Population Trends for Washington State, October 1995.

²Rate per 1,000 population.

³Rate per 1,000 live births.

⁴1979-1988 maternal death figures are based on a study using both birth and death certificates; maternal deaths in other years are based only on the death certificate and may undercount deaths due to complications of pregnancy.

⁵Rate per 10,000 live births.

¹Counties in columns are ranked based on total births by place of occurrence. The following counties are not shown since the number of births occurring there was less than five: Asotin (2), Columbia (0), Garfield (0), Skamania (1), Wahkiakum (0).

²Counties in rows are ranked based on total births by mother's residence.

³Of all births occurring statewide, 33.3% occurred in King County alone, 46.8% occurred in King and Pierce counties, and so on.

¹Counties in columns are ranked based on total births by place of occurrence. The following counties are not shown since the number of births occurring there was less than five: Asotin (0), Columbia (0), Douglas (2), Garfield (0), Skamania (1), Wahkiakum (0).

²Counties in rows are ranked based on total births by mother's residence.

³Of all births occurring statewide, 33.0% occurred in King County alone, 46.2% occurred in King and Pierce counties, and so on.

DEAA02P2

¹Rate per 100,000 population in each age-sex group

²Percent of total deaths in each age-sex group. Percents may not add to 100% due to rounding.

*Rate not calculated because number of deaths was less than 5.

DEAA09P2

¹Ratio per 1,000 live births.

²Fetal deaths plus liveborn infants dying at 6 days and under.

³Rate per 1,000 live births plus fetal deaths.

⁴Rate per 1,000 live births.

*Rate or ratio not calculated because number of deaths was less than 5.

¹Includes a large number of decrees in which type of decree was unspecified due to errors in the conversion of the automated information system.

²Excludes 32 divorces for which certificates of dissolution were not filed with the Center for Health Statistics, but were submitted only as court orders: 31 King County, 1 Pend Oreille County.

³Since legal separations are not final dissolutions of marriage they are excluded from the total. In 1991, however, due to conversion errors an estimated 300-400 legal separations are counted as divorces.

¹Excludes 84 divorces for which certificates of dissolution were not filed with the Center for Health Statistics, but were submitted only as court orders: 80 King County, 4 Shohomish County

²Since legal separations are not final dissolutions of marriage they are excluded from the total.

¹Excludes 84 divorces for which certificates of dissolution were not filed with the Center for Health Statistics, but were submitted only as court orders: 82 King County, 2 Shohomish County.

²Since legal separations are not final dissolutions of marriage they are excluded from the total.

¹Excludes 66 divorces for which certificates of dissolution were not filed with the Center for Health Statistics, but were submitted only as court orders: 63 King County, 2 Snohomish County, 1 Klickitat County.

²Since legal separations are not final dissolutions of marriage they are excluded from the total.

¹Excludes 145 divorces for which certificates of dissolution were not filed with the Center for Health Statistics, but were submitted only as court orders: 140 King County, 4 Thurston County, 1 Pend Oreille County.

²Since legal separations are not final dissolutions of marriage they are excluded from the total.

²Certificate of dissolution records, "Children born alive of this marriage." All children are counted regardless of age.

³Does not include residents who obtain divorces or annulments outside of Washington State.

Appendices

Appendix A : Technical Appendix

Sources of Data

Collection Year

Data for *Washington State Vital Statistics, 1994 & 1995* are compiled from items on birth, death, fetal death, marriage and dissolution certificates received before April 15 of the following year. For example, the cutoff date is April 15, 1995 for 1994 data (See Appendix F for samples of certificate forms used.)

Population

Population data in this report are estimates of the population provided by the Washington State Office of Financial Management, Forecasting Division, *Postcensal and County Population Estimates by Age and Sex*. There are several editions of this publication. The exact edition used is noted in the footnotes to the appropriate tables.

Life Expectancy

Life expectancy is based on 1994 and 1995 crude mortality rates.

Classification of Data

Classification and coding of data on Washington State vital records follow National Center for Health Statistics (NCHS) guidelines as defined in *'Vital Statistics Instruction Manuals'* parts 1-20 (Published by US Department of Health and Human Services, Public Health Service, Centers for Disease Control and Prevention, National Center for Health Statistics, Hyattsville MD).

Age

In 1989, the birth certificate item on mother's and father's ages was replaced by mother's and father's date of birth. The actual birth date provides more detail than the ages alone and can be used in linking birth data with other files. As of 1989, therefore, ages are computed from parents' birth dates and the date of delivery. A comparison of parents' age distributions before and after the change showed that ages calculated from birth dates are consistent with ages determined by asking the mother and that there is no substantial increase in missing data as a result of asking for the more detailed birth dates.

The death certificate contains fields for specified age at death and also birth and death dates, which are used to calculate age at death. Records where the specified and calculated ages differ were verified against hard copy certificates. Where there is a difference of one year, the calculated

age was used for age at death (which assumes that the informant made an arithmetic error). Where there is a difference of greater than one year, the specified age is used.

For infant deaths (<1 year), age is measured in minutes, hours, days, or months. Some certificates may report a primary and secondary age, e.g., 1 month 2 weeks. This report uses only the primary age (e.g., 1 month). The secondary age (e.g., 2 weeks) is dropped off, so the infant's age is truncated at the primary age category.

Race

Race data collected on vital statistics follow the definition established by the Census Bureau, as follows:

The concept of race as used by the Census Bureau reflects self-identification; it does not denote any clear-cut scientific definition of biological stock. The data for race represents self-classification by people according to the race with which they most closely identify. Furthermore, it is recognized that the categories of the race item include both racial and national origin or socio-cultural groups.¹

Birth and death certificates use open-ended reporting of race, allowing for multiple racial entries. The determination of race for multiple racial entries follows decision rules established by the National Center for Health Statistics (NCHS): If more than one race is listed and one is Hawaiian, then Hawaiian is selected. For other races, the first race listed is selected. Prior to 1990, the first non-white race listed was selected (unless Hawaiian was listed somewhere in the item). This change increases the number of events coded 'White' and decreases the number of events coded to other races. Thus, race-specific birth or death rates may not be comparable for the two time periods before and after the change.

To determine race of newborns on birth certificates, each parent's race is first established according to the previous rule. Rules to determine race of the child, then, fall along a similar pattern:

- If either parent is Hawaiian, then the child's race is considered Hawaiian.
- In cases where one parent is white and the other non-white, the non-white race is selected as the race of the child.
- If both parents are non-white, the father's race is selected except where the mother's race is Hawaiian.

¹ U.S. Bureau of the Census, *1990 Census of Population: General Population Characteristics*, Washington, Report 1990 CP-1-49, Washington, D.C., June 1992.

Child's race data tabulated in this report use the calculated child's race. In addition to this calculated race, the mother also has the choice of designating a race/Hispanic origin for her child. These designated race data are only available starting in 1992.

Reporting of race/Hispanic origin on death certificates is sometimes based on observing the decedent, rather than questioning the next of kin. This procedure causes an underestimate of deaths for certain groups, particularly Native Americans, some of the Asian subgroups, and Hispanics. Thus, death rates based on death certificate data are lower than true death rates for these groups.

Because the denominator for infant mortality rates uses the race at birth, the most accurate race-specific infant mortality rates come from linked birth-infant death data files, where the child's or the mother's race at birth can be used for both the numerator and the denominator.

Hispanic Origin

'Origin' as used by the Census Bureau refers to "the ancestry, nationality group, lineage, or country of birth of the person or the person's parents or ancestors before their arrival in the United States." Persons of Hispanic origin have their origins in a Hispanic or Spanish-speaking country such as Mexico, Cuba, or Puerto Rico, or the Spanish-speaking countries of Central or South America. Persons of Hispanic origin may be of any race.

Hispanic origin was added as an ethnic category and collected as a separate item (in addition to race) in 1988. For the first year of data collection (1988), some hospitals did not include the ethnicity item on the worksheet used to collect birth data and some facilities used the 1987 death certificate form, which did not have the ethnicity item. For this reason, Hispanic ethnicity data are less complete for 1988 than they are for later years. Rates calculated using these 1988 data will be lower than rates for other years because of this underreporting and should thus not be used to study changes in Hispanic birth or death rates.

Prior to 1988, Hispanic data were provided by a racial category of "Mexican/Chicano" or "Mexican American". Data based on Hispanic origin from those years are not comparable with data collected in 1988 or thereafter and should not be used for trend analysis or year-to-year comparisons.

The certificates for live births, deaths, and fetal deaths in Washington State capture Hispanic origin under two separate items, one to measure ethnicity and another to measure race. The item measuring ethnicity asks, [Is the person] "Of Hispanic Origin or descent (Ancestry)?" and permits a "Yes/No" response. The item measuring race on the birth and fetal death certificates says, "Race (American Indian, White, Black, Asian/Pacific Islander (Specify subgroup), etc.). On the death certificate, the item reads,

"Race (Specify)." Although Hispanic is not listed as a sample response under "Race" beginning in 1992, it is still provided as a racial designation, particularly for people who have already been classified as being of Hispanic origin ethnicity.

The National Center for Health Statistics (NCHS), however, does not treat Hispanic Origin as a race and requires instead that persons reporting Hispanic as a race be counted as "White." Tables in this report use this NCHS convention for tabulations by race. In addition, at the end of each table on race, counts of persons identified as "Hispanic Origin" under the ethnicity item are provided as well.

County of Residence

In addition to county of residence data provided by the informant, the county was occasionally reassigned by GEOVISTA, a computer program that determines county based on street address. If a post office box is given as the address (which happens rarely), the program does not attempt to reassign the county. In these cases, the county originally specified by the informant was used. Where there were differences between the two ways of determining county of residence, the geocoded county overwrote the original county given by the informant. This geocoding was done for 1987-1995 births, deaths and fetal deaths. Geocoding could not be done for earlier data because address information is unreliable for those years.

In general, good agreement was found between the geocoded county and the county originally given by the informant. Differences were found for about 0.2-0.3% of the births and 0.1% of the deaths. Most of the differences were due to zip codes which cross county boundaries, where the informant may not have known what the county of residence was. The differences amounted to very small proportions of births or deaths in the affected counties. Because county of residence was not geocoded for earlier years, county data will be somewhat inconsistent with data for later years. However, discrepancy rates are expected to be only about 0.2% for births and 0.1% for deaths.

In the few remaining instances in which the county or city of residence or occurrence is unknown, the county/city was imputed using NCHS guidelines. For occurrences, if the county is known but the city is not, the occurrence is set to the rural county value (no defined city). If both county and city are unknown, the occurrence is set to the occurrence county and city of the previous record. For residences, if the county is known but the city is not, the residence is set to the rural county value (no defined city). If both county and city of residence are unknown but the birth or death occurred in Washington, the residence is set to the county/city of occurrence. If both county and city of residence are unknown and the birth did not occur in Washington, the residence is set to the largest city in the state (Seattle).

Low Birth Weight

Traditionally, low birth weight has been defined as 2,500 grams or less. However, the International Classification of Diseases, Ninth Revision (ICD-9) redefines low birth weight as less than 2,500 grams. Thus, according to national guidelines, a birth weight equal to 2,500 grams would now be included with the normal birth weight category. As of 1994, the birth weight categories published in this report have been revised, in accordance with these guidelines.

The impact of the change is small in the United States, where many weights are given in pounds and ounces. No weight of pounds and ounces converts exactly to 2,500 grams (5-lb 8-oz is 2,495 g and 5-lb 9-oz is 2,523 g). It is, therefore, unlikely that many weights of 2,500 grams are recorded. In fact, in Washington State before 1992, if a weight in grams were recorded on the birth certificate, it was converted to pounds and ounces at data entry, then reconverted to grams for data analysis. Using this method, a weight of 2,500 grams was converted to 5-lb 8-oz, which was reconverted to 2,495 grams. Thus, no weights of exactly 2,500 grams were found. Starting in 1992, weights in grams could be directly entered into the computer. In 1992-1994, an average of 11 births per year were recorded with weights of exactly 2,500 grams (0.3% of the low birth weight births).

Even though the impact of the change is very small at the state level, it could have a larger effect on low birth weight rates for a small county, if the county has any births at 2,500 grams.

Maternal Smoking

This item has undergone some wording and placement changes over time. For 1984-88, it asked about 'Smoking at any time during the pregnancy' and was placed in the middle section of the certificate, which the mother generally completes from a worksheet. With the 1989 revision, the wording was changed to 'Tobacco use during pregnancy' (which could include smokeless tobacco) and the item was relocated to the bottom of the certificate, which is generally completed by the physician (often without access to prenatal records). The percentage of missing data increased from 4% in 1984 to 13% in 1989, possibly because the change in placement on the certificate changed the way the data were collected. To eliminate the problem and provide more comparable data, the item was changed in 1992 to its original wording and placement on the certificate. The proportion of births with unknown maternal smoking decreased to 3.7% in 1992. Thus, data for 1989-91 may not be comparable to data from other time periods.

Cause of Death

The causes of death presented in this report are classified in accordance with the International Classification of Diseases, Ninth Revision published

by the World Health Organization. The State of Washington began using this revision on January 1, 1979.

Tabulated causes of death in this report are based on the underlying cause of death. The underlying cause of death is defined as 'the disease or injury which initiated events resulting in death.' The underlying cause of death receives a four-digit code. For an external event (accident, suicide, homicide), the same four-digit code can have two different meanings depending on the context. For example, an injury code of 950.0 means 'optic nerve injury' whereas an external event code of E950.0 means 'suicide by analgesics, antipyretics, and antirheumatics.' In nosological rules for coding underlying cause of death, one can only die of the external events that produced an injury. One does not die of the head injury (854); rather one dies of the fall from a ladder (E884.2) which resulted in the head injury. Therefore, all injury death data published in this report use the external event ('E') code rather than the nature of injury code.

Ranking of Leading Causes of Death

In the interest of comparability, this report uses, in general, the cause of death groups used by the National Center for Health Statistics (NCHS).

Cause of Death Groupings

The following changes were made to cause of death groupings in order to facilitate comparisons with tabulations of deaths prepared by the National Center for Health Statistics and Healthy People 2000.

a. Heart Disease: The group for heart disease now includes ICD-9 codes 390-398, 402, and 404-429. Previous heart disease groups excluded ICD 390, 392.9, and 405 (which account for few, if any, deaths). Deaths from ICD-9 code 429.2 (Unspecified cardiovascular disease) are no longer grouped with 'Other heart disease,' but are published separately so that users can calculate a total for coronary or ischemic heart disease, for comparison with HP 2000 goals.

b. Cancer: Carcinoma in situ (ICD 230-234) is no longer grouped with malignant neoplasms but is now included with 'Benign and Unspecified Neoplasms (ICD 210-239). (Deaths from carcinoma in situ rarely occur.) Malignant neoplasm of intestinal tract, part unspecified (ICD 159.0) is no longer grouped with 'Digestive Organs and Peritoneum - Other and Ill-Defined Sites.' Malignant neoplasm of trachea (ICD 162.0) is no longer grouped with 'Lung Cancer' These two categories are published separately, to facilitate comparison with HP 2000 goals.

c. Diseases of the Nervous System and Sense Organs: Meningitis (ICD 320-322) and Alzheimer's Disease (ICD 331.0) are now tabulated separately. 'Other Hereditary and Degenerative Diseases of the Central Nervous System' (ICD 330-337) are no longer tabulated separately but

are grouped with 'Other Diseases of the Nervous System and Sense Organs.'

d. Injuries: Late effects of specific injuries (ICD E929) are no longer included with the specific injury (such as a fall) but are grouped as a single category 'Late Effects of Accidental Injury.'

Tables affected by these changes are: 20E, 20F, 21-24, 29A, 30A, 30B, 32, 35, 38A, 38B.

Maternal Death

Maternal deaths are those for which a maternal condition (ICD-9 codes 630-676) is given as the underlying cause of death. The World Health Organization defines a maternal death as:

The death of a woman while pregnant or within 42 days of termination of pregnancy, irrespective of the duration and the site of the pregnancy, from any cause related to or aggravated by the pregnancy or its management but not from accidental or incidental causes.

A death will be coded as maternal only if the death certificate notes pregnancy or a maternal condition. In 1979-1988, Washington State supplemented reported maternal deaths with results from a special study. Death certificates for women ages 15-44 were linked to birth/fetal death certificates to see if the woman had had a delivery within 42 days of the death. If so, the cause of death was examined to see if the death could have been related to the pregnancy. This special study added an average of two maternal deaths per year, a substantial change because only about three deaths per year are reported as maternal. Thus, considerable underreporting of maternal deaths is suspected for years when this linkage procedure has not been done.

Definitions

Birth Weight - Weight of fetus or infant at time of delivery (normally recorded in pounds and ounces).

Fetal Death - Death prior to the complete expulsion or extraction from its mother of a product of human conception, irrespective of the duration of pregnancy. The death is indicated by the fact that after such expulsion or extraction the fetus does not breathe or show any other evidence of life such as beating of the heart, pulsation of the umbilical cord, or definite movement of voluntary muscles. Reporting of fetal deaths to the state is required only when the gestational period is twenty weeks or more.

Infant Death - Death of a child under one year of age.

Live Birth - The complete expulsion or extraction from its mother of a product of human conception, irrespective of the duration of pregnancy, which, after such expulsion or extraction, breathes, or shows any other evidence of life such as beating of the heart, pulsation of the umbilical cord, or definite movement of voluntary muscles, whether or not the umbilical cord has been cut or the placenta is attached.

Live Birth Order - Total number of live births to a given mother, including current birth.

Maternal Death - Death attributed to complications of pregnancy, childbirth, or the puerperium (ICD 630-676) for women of childbearing age; includes abortion related death.

Neonatal Death - Death of an infant within the first 27 days of life.

Nulliparous - Having never given birth to a liveborn infant.

Occurrence Data - Data allocated by place where the event occurred, regardless of the person's place of residence.

Parity - Total number of previous live births; does not include the current birth.

Perinatal Death - Fetal deaths plus deaths to infants within the first six days of life.

Plurality - The number of siblings born as the result of a single pregnancy (e.g., twins, triplets).

Postneonatal Death - Death of an infant of 28-364 days of age.

Premature Birth - A live birth weighing 2,500 grams (5-1/2 pounds) or less. If birth weight is not stated, length of gestation (under 37 weeks) is used.

Residence Data - Data allocated by place of residence of the child's mother (births, fetal deaths), or by place of residence of the decedent (deaths), regardless of where the event occurred.

Underlying Cause of Death - The disease or injury which initiated the train of morbid events leading directly or indirectly to death or the circumstances of the accident or violence which produced the fatal injury.

Rates and Ratios

Rounding of Rates - Rates are rounded to the nearest tenth. When the rate or percent is less than one-tenth, the entry is 0. Rates are not calculated when the number of events is less than 5.

Rates and Ratios Used in this Report - Rates and ratios are calculated by dividing the number of events of concern by the population at risk (or a related population) and multiplying by a standard constant (i.e., 1,000 or 10,000 or 100,000).

$$(Crude) Birth Rate = \frac{\# Live Births}{Total Population} \times 1,000$$

$$Age - Specific Birth Rate = \frac{\# Births for Specific Age Group}{Population for Same Age Group} \times 1,000$$

$$(Crude) Death Rate = \frac{\# Deaths}{Total Population} \times 1,000$$

$$Age - Specific Death Rate = \frac{\# Deaths for Specific Age Group}{Population for Same Age Group} \times 100,000$$

$$Cause - Specific Death Rate = \frac{\# Deaths for Specific Cause}{Total Population} \times 100,000$$

$$Infant Death Rate = \frac{\# Infant Deaths}{Total Live Births} \times 1,000$$

$$Neonatal Death Rate = \frac{\# Neonatal Deaths}{Total Live Births} \times 1,000$$

$$Postneonatal Death Rate = \frac{\# Postneonatal Deaths}{Total Live Births} \times 1,000$$

$$Maternal Death Rate = \frac{\# Maternal Deaths}{Total Live Births} \times 10,000$$

$$Fetal Death Ratio = \frac{\# Fetal Deaths}{Total Live Births} \times 1,000$$

$$Perinatal Death Rate = \frac{\# Perinatal Deaths}{Live Births + Fetal Deaths} \times 1,000$$

Appendix B. Conversion of Birth Weight in Grams to Pounds and Ounces

Weight in Grams	Pounds and Ounces
Under 1,000	2lbs. 3 oz. and less
1,000 - 1,499	2 lbs. 4 oz. - 3 lbs. 4 oz.
1,500 - 1,999	3 lbs. 5 oz. - 4 lbs. 6 oz.
2,000 - 2,499	4 lbs. 7 oz. - 5 lbs. 8 oz.
2,500 - 2,999	5 lbs. 9 oz. - 6 lbs. 9 oz.
3,000 - 3,499	6 lbs. 10 oz. - 7 lbs. 11 oz.
3,500 - 3,999	7 lbs. 12 oz. - 8 lbs. 13 oz.
4,000 - 4,499	8 lbs. 14 oz. - 9 lbs. 14 oz.
4,500 and over	9 lbs. 15 oz. and over

appendix.xls

One pound = 453.59 grams

Appendix C. Estimated Population, State of Washington, by Age Group by Sex, April 1, 1994

Age Group	Total	Male	Female
Total	5,334,400	2,651,776	2,682,624
Under 1 Year ¹	77,314	39,540	37,774
1 - 4	338,356	173,285	165,071

Appendix F

Sample Certificates:

**Live Birth, Death, Fetal Death,
Marriage, and Divorce**

CERTIFICATE OF LIVE BIRTH

LOCAL FILE NUMBER

STATE FILE NUMBER

1. CHILD'S NAME (First, Middle, Last), 2. SEX (M/F), 3. DATE OF BIRTH (MO, DAY, YR), 4. TIME OF BIRTH, 5. TYPE OF BIRTHPLACE (SPECIFY TYPE), 6. NAME OF FACILITY / IF NOT A FACILITY ENTER NAME OF PLACE AND ADDRESS, 7. CITY / TOWN / LOCATION, 8. COUNTY OF BIRTH, 9. I CERTIFY THAT THIS CHILD WAS BORN ALIVE AT THE PLACE AND TIME AND ON THE DATE STATED, 10. DATE SIGNED (MO, DAY, YR), 11. ATTENDANT'S NAME AND TITLE (If other than certifier) (Type or Print), 12. CERTIFIER --- NAME AND TITLE (Type or print), 13. ATTENDANT'S MAILING ADDRESS (street / box no., city, state, ZIP code), 14. FATHER'S NAME (First, Middle, Last), 15. DATE OF BIRTH (MO, DAY, YR), 16. STATE OF BIRTH (If not USA give country), 17. MOTHER'S NAME (First, Middle, MAIDEN), 18. DATE OF BIRTH (MO, DAY, YR), 19. STATE OF BIRTH (If not USA give country), 20. MOTHER'S RESIDENCE (number and street), 21. CITY / TOWN / LOCATION, 22. INSIDE CITY LIMITS (Yes/No), 23. COUNTY, 24. STATE / ZIP CODE, 25. HOW LONG AT CURRENT RESIDENCE? (Yrs., Mos.), 26. MOTHER'S MAILING ADDRESS (if different than residence), 27. NAME OF INFORMANT (Type or print), 28. RELATION TO CHILD, 29. PARENT(S) REQUEST FOR SOCIAL SECURITY NUMBER ISSUANCE (allow up to 6 months) (Yes/No), 30. REGISTRAR (signature), 31. DATE FILED BY LOCAL REGISTRAR, 32. RECORD AMENDMENT (state registrar use only) DOCUMENTARY EVIDENCE ITEM DATE, 33. FATHER'S SOCIAL SECURITY NUMBER, 34. MOTHER'S SOCIAL SECURITY NUMBER

35. OF HISPANIC ORIGIN OR DESCENT? If yes, specify, Mexican, Puerto Rican, Spanish, etc. (FATHER, MOTHER, CHILD), 36. RACE (American Indian, White, Black, Asian/Pacific Islander (Specify subgroup), etc.), 37. OCCUPATION (Worker during last year) (registered nurse, person in manager), 38. TYPE OF BUSINESS OR INDUSTRY (corporation, newspaper publishing), 39. EDUCATION (specify only highest grade completed) Elementary / HS (9-12) / College (1-4 or 5+), 40. OF HISPANIC ORIGIN OR DESCENT? If yes, specify, Mexican, Puerto Rican, Spanish, etc. (CHILD), 41. RACE (American Indian, White, Black, Asian/Pacific Islander (Specify subgroup), etc.), 42. PRIOR LIVE BIRTHS (Do not include this birth) NONE NOW LIVING NOW DEAD, 43. OTHER TERMINATIONS (Not live births) NONE 20 WKS OR MORE LESS THAN 20 WKS DATE LAST SPONTANEOUS OUTCOME (MO, YR), 44. TOTAL PRIOR PREGNANCIES, 45. CLINICAL ESTIMATE OF GESTATION (WEEKS), 46. DATE LAST NORMAL MENSES BEGAN (MO, DAY, YR), 47. IS MOTHER MARRIED? (Yes/No), 48. MONTH OF PREGNANCY PRENATAL CARE BEGAN (1st, 2nd, 3rd, etc), 49. TOTAL NUMBER OF PRENATAL VISITS (if none, enter 0), 50. PRINCIPAL SOURCE OF PAYMENT FOR PRENATAL CARE (Medical, Government, Self pay, Charity care, Other), 51. DURING PREGNANCY MOTHER PARTICIPATED IN (WIC, First Steps, AFDC, Services from Local Health Dept), 52. DID MOTHER SMOKE AT ANY TIME DURING PREGNANCY? (Yes/No/Average no. cigarettes per day?), 53. PLURALITY—Single, Twin, Triplet, etc. (Specify), 54. IF NOT SINGLE BIRTH—born 1st, 2nd, 3rd, etc. (Specify), 55. BIRTH WEIGHT (lbs. & ozs.), 56. APGAR SCORE (1 min., 5 min.), 57. INFANT TRANSFERRED TO ANOTHER FACILITY? (Yes/No/UNK), 58. MOTHER TRANSFERRED AFTER ATTEMPTED DELIVERY (If yes, from Birth Ctr. Home Other)

CHECK ALL BOXES IN EACH COLUMN THAT APPLY

59. MEDICAL RISK FACTORS FOR THIS PREGNANCY

- 1. Anemia (Hct <30 / Hgb <10)
2. Cardiac disease
3. Acute or chronic lung disease
4. Diabetes, Gest. Etabl.
5. Genital herpes—active
6. Polyhydramnios
7. Oligohydramnios
8. Hemoglobinopathy
9. Hypertension, chronic
10. Hypertension, pregnancy-associated
11. Eclampsia
12. Incompetent cervix
13. Previous infant 4000 + grams
14. Previous preterm or small-for-gestational-age infant
15. Renal disease
16. Rh sensitization
17. Uterine bleeding - trimester
18. Hepatitis B - HBsAg Positive
19. Syphilis
20. None
21. Other (specify)

60. OTHER RISK FACTORS FOR THIS PREGNANCY

- 1. Alcohol use during pregnancy? Yes No Av. No. drinks per wk?
2. Weight gained during pregnancy lbs.
3. Weight before pregnancy lbs.

61. OBSTETRIC PROCEDURES

- 1. Amniocentesis—If yes, specify trimesters
2. Electronic fetal monitoring
3. Induction of labor
4. Stimulation of labor
5. Tocolysis

(CONTINUED NEXT COLUMN)

62. METHOD OF DELIVERY

- 1. Vaginal
2. Vaginal birth after previous C-section
3. Primary C-section
4. Repeat C-section with labor no labor
5. Forceps
6. Vacuum extraction
9. Other (specify)
63. COMPLICATIONS OF LABOR AND/OR DELIVERY
1. Febrile (>100° F or 38° C)
2. Meconium, moderate / heavy
3. Premature rupture of membrane (>12 hrs)
4. Abruptio placenta
5. Placenta previa
6. Other excessive bleeding
7. Seizures during labor
8. Precipitous labor (<3 hrs)
9. Prolonged labor (>20 hrs)
10. Dysfunctional labor
11. Breech / Malpresentation
12. Cephalopelvic disproportion
13. Cord prolapse
14. Anesthetic complications
15. Fetal distress
16. Nuchal cord
17. None
18. Other (specify)

64. ABNORMAL CONDITIONS OF THE NEWBORN

- 1. Anemia (Hct <39 / Hgb <13)
2. Birth injury

(CONTINUED NEXT COLUMN)

- 3. Fetal alcohol syndrome
4. Hyaline membrane disease/RDS
5. Meconium aspiration syndrome
6. Drug withdrawal syndrome in newborn
7. Assisted ventilation < 30 min.
8. Assisted ventilation ≥ 30 min.
9. Seizures
10. None
11. Other (specify)

65. CONGENITAL ANOMALIES OF CHILD

- 1. Anencephalus
2. Spina bifida / Meningocele
3. Hydrocephalus
4. Microcephalus
5. Other central nervous system anomalies (specify)
6. Heart malformations
7. Other circulatory / respiratory anomalies (specify)
8. Rectal atresia / stenosis
9. Tracheo-esophageal fistula / Esophageal atresia
10. Omphalocele / Gastroschisis
11. Other gastrointestinal anomalies (specify)
12. Malformed genitalia
13. Renal agenesis
14. Other urogenital anomalies (specify)
15. Cleft lip / palate
16. Polydactyly / Syndactyly / Adactyly
17. Club foot
18. Diaphragmatic hernia
19. Other musculoskeletal / integumental anomalies (specify)
20. Down's syndrome
21. Other chromosomal anomalies (specify)
22. None
23. Other anomalies (specify)

CERTIFICATE OF DEATH

146

LOCAL FILE NUMBER

STATE FILE NUMBER

1. NAME First Middle Last				2. SEX (M / F)		3. DEATH DATE (Mo., Day, Yr)
