

A close shave can save.

Facial hair affects your safety when wearing a respirator. Even a day's growth of facial hair can create a small gap between the respirator and your face, which can break the seal that keeps infectious particles from entering the respirator.

The red line in the bar measures the amount of particles that enter the respirator through the gap caused by facial hair.

24 Hour beard growth: Particles well over accepted level

Clean Shaven: Particles Near 0

Staying clean shaven ensures your respirator fits correctly providing you with the best possible protection!
