The time to vaccinate children against COVID-19 is now.

Since the beginning of the pandemic, over 15 million children in the United States have gotten COVID-19. New COVID-19 variants are more dangerous and infectious to children than the original strains.

Children can also spread COVID-19 to others and develop serious complications from COVID-19, such as “long COVID” or a dangerous inflammatory disease called MIS-C.

Nationwide, COVID-19 has caused:
- Over 2,000 deaths in children
- 188,000 hospitalizations in children

Most children do not experience serious side effects from the vaccine. Vaccination remains the strongest tool we have to protect against severe illness, hospitalizations, and death.

During the omicron-predominant period, unvaccinated children were 2 times as likely to be hospitalized with COVID-19 illness compared to vaccinated children.

Children in Washington:
- Ages 6 months – 4 years old
  - 82% have not received their first dose of the vaccine
  - 88% have not completed their primary series
  - 73% of those eligible have not received an updated booster
- Ages 5–11 years old
  - 63% have not received their first dose of the vaccine
  - 67% have not completed their primary series
  - 73% of those eligible have not received an updated booster

Statewide, COVID-19 has caused:
- Over 378,000 cases in children
- Over 2,000 hospitalizations in children
- 21 deaths in children
