## Overview

The Washington Department of Health (WA DOH) contracted with Market Decisions Research (MDR) to develop and administer the Child Wellness Survey based on the survey initiated by King County. In addition to the main survey about 0–5-year-olds, MDR and WA DOH also fielded a smaller pilot survey about 6–11-year-olds.

## Survey

The Child Wellness Survey instrument was developed based on the Best Starts for Kids Health Survey - a King County survey that has been administered to King County residents since 2015. King County estimates were integrated with the rest of the CWS data to produce statewide CWS estimates. The pilot survey of 6–11-year-olds was also based on this preexisting survey but with additional topics included more relevant to that age group.

## Sampling

WA DOH used the Washington (WA) State Birth Certificate (BC) Data and Immunization Information Systems (IIS) Registry for both the 0-5 survey and the 6-11 Pilot survey. Sampling was stratified by DOH-defined CWS regions and non-mutually exclusive race and ethnicity groups for the 0-5 survey, and by race and ethnicity groups for the 6-11 survey. King County was excluded in CWS sampling.

The goal was to get 7,600 completes for the 0-5 survey and 500 completes for the 5-11 survey. A total of 20,611 Washington residents were sampled for the 0–5-year-old survey, while 4,500 were sampled for the 6–11-year-old pilot survey.

A non-probability community-based sample was opened at the end of each survey cycle to increase sample sizes for small populations and to increase community engagement in the survey.

# Methodology

---

## Weighting

CWS data was weighted by WA DOH. Data weighting is an analytical process that is used to correct for biases and to make the data accurately represent a larger population.

## Presentation of results

All results presented in this report are based on the final weighted dataset to reflect the overall population of the state – including King County residents, unless specified otherwise. Some results don't include King County data because those questions were not asked on their survey.

## Missing Values

Respondents were provided an opportunity to skip any question they did not want to answer in the survey by providing a “don't know” or “no answer” response. While the item level non-response is relatively low for most questions (in the low single digits) please note that the percentages reported in the tables and charts in this report reflect the percentages of valid responses, with “don't know” and “no answer” responses excluded from the calculations.

# Methodology

---

## Data Collection

Data collection was multimode, consisting of push-to-web letters linking individuals to an online survey and telephone calls where individuals could complete the survey over the phone. Data collection occurred from August 7<sup>th</sup> 2024 to April 4<sup>th</sup>, 2025 and consisted of a series of mailed invitation and reminder letters, followed by telephone outreach to non-respondents. Sampled individuals successfully completing the survey were given a \$20 digital gift card as a token of appreciation. A total of 5917 completes from Washington residents were obtained across all modes and forms of data collection, with 4119 completing the survey online, 1731 by phone, 36 as part of a panel and 31 as part of the community-based convenience sample. Another 2,750 responses were added from the 2023 King County's Best Starts for Kids Health Survey data to include King County residents for state-level results presented here.

## Data Analysis

Data analysis was a collaboration between MDR and WA DOH. Survey results were exported from Voxco data collection software into SPSS, where data cleaning, verification, and analysis occurred.

## Additional Information

Additional information on sampling, data weighting, and data analysis are provided in the sampling and analytical plans. Questions that were asked in the WA CWS that were not asked in the King County survey are noted throughout the report.

# Key Findings

# Key Findings

---

## General Child Health Information

- Most children were reported to be in good health with 91% of respondents stating that their child had excellent or very good health.
- Almost 4 in 10 (39%) respondents stated that they had to, at least once, fill out a questionnaire due to concerns about their child's behaviors and/or development.
- More American Indian/Alaska Native families (23%) report the need for medical care, mental health care or educational services compared to the overall sample (16%).

## General Child Health Information (continued)

- While a notable percent (17%\*) stated that their child did experience some type of disability, the majority of respondents stated that their child did not have any type of disability.
  - Needs and limitations are more commonly reported for male children than female children, with 19% of males versus 13% of females needing or using more medical/mental health/educational services than usual; 11% of males versus 7% of females having activity limitations; and 20% of males versus 14% of females reported to have a disability.

\*This detailed disability question was not asked on the King County Survey. So, disability results do not include King County residents.

# Key Findings

---

## Child's Personality

**Overall, most children were described as affectionate, curious, and resilient.**

- 92% of children were described as affectionate and tender, mirroring the 93% of children who were described as curious whereas a smaller percent (55%) were described as resilient when things did not go their way.

**On the composite flourishing/resilience index, 50% of respondents' children reach the top score.**

- Flourishing differs across groups: girls (53%) exceed boys (49%); one-child households are higher (57%) than two-child (49%) or 3+ children (47%); and by language where another language households (59%) exceed English households (49%).

## This Child as a Baby

- Over 9 in 10 children (92%) were reported to have been given breast/chestmilk at some point in their childhood. Nearly half of children of children who were breast/chestfed continued having breastmilk until they were over 12 months old (44%) and 54% of breast/chestfed children were introduced to nourishment other than breast/chestmilk by 6 months old.
  - The prevalence of breast/chestfeeding rises with rising caregiver education and income (e.g., 97% among \$150,000+ households; 96% among \$100,000–\$149,999), and varies by language—another language households and English households are very high (93% and 92%, respectively), while Spanish-speaking households are lower (84%).

# Key Findings

---

## Health Care Services

- Almost a third (32%) of children needed referrals to doctors or services in the past year.
- Most caregivers (74%) were able to access necessary referrals to additional care, however, a notable percent (26%) of caregivers reported difficulties obtaining referrals.

## Activities and Child Care

- The type of child care utilized by Washington families is diverse from in-home daycares to preschool to kindergarten; one-fifth (20%) of children attend a child care center or full-day preschool
- Formal childcare settings, such as childcare centers, preschools and in-home licensed care (74%), were more common than informal childcare such as relying on friends or family for care (26%).

## Activities and Child Care (continued)

- Respondents generally rated their childcare positively for safety, nurturing, and learning; however, affordability and availability challenges were noted.
  - Over three-quarters (76%) of caregivers rate their primary child care setting as nurturing, 71% as meeting cultural or language needs, and 80% as safe.
- Caregivers reported difficulty with many aspects of childcare
  - 25% experienced challenges finding child care that met their family's health or cultural needs, 38% reported missing work/school at least once due to unreliable care, and 63% stated it was challenging to find care that they could afford.

# Key Findings

---

## About You and This Child

- Most (80%) of respondents stated that they have someone they can turn to for day-to-day emotional support with raising children; however, a notable percent (20%) of caregivers do not have someone they can turn to for parenting support.
- Almost all (99%) caregivers recognize the importance of understanding their child’s feelings and acknowledge the significant role their play in child development.
- Stress is notable among caregivers - 34% *agree* they feel like they are always telling their child “no/stop”, and 32% *agree* that how they respond to their child depends on how they feel.

## Family and Household

- Many respondents stated that their family had the strength to solve problems (95%) and help each other through challenges (98%), while also rating family traditions as important (92%).
- Engaging with children was something that occurred frequently with 69% of respondents stating their child was read to, told stories, or sung to everyday.
- Despite strengths, a notable percentage of caregivers reported struggling to afford basic needs such as child care (30%), housing (26%), food (25%), diapers (23%), Internet (22%), transportation (20%), and health care (20%).

# Key Findings

---

## Neighborhood

- Across some specific indicators respondents agree that neighbors help (78%) and watch out for each other (79%), and that they know where to find support (83%) within their neighborhoods.
- However, respondents overall had mixed feelings about their neighborhoods. A calculated index of neighborhood safety showed that less than half (45%) of respondents feel they have a supportive neighborhood.

## Vaccination Behaviors and Attitudes

- Most (81%) respondents stated that their children received vaccinations on time.
- Of those that delayed vaccines, reasons for delays included worries about the safety of vaccines (56%), fear of obtaining too many vaccines at one time (50%), religious/personal beliefs (45%), or access-related barriers (15%). Over half (52%) of those that delayed vaccines provided more than one reason for the delay.
- When asked for the single most important reason, respondents most often cited safety/side-effect concerns (45%).

# Detailed Findings

# How to Read Detailed Findings

## Suppressed Tables

Tables have been suppressed according to the Washington Department of Health’s suppression guidelines. Tables contain various symbols associated with these suppression guidelines. Below is a legend for how to read these symbols.

## Unsuppressed Tables

Less strict suppression rules are applied in the unsuppressed tables. Below is a legend for how to read these symbols.

Symbol	Meaning
NR	Not reported due to small sample size (n<40)
#	Estimate suppressed due to small numbers (<10); statistically unreliable
*	Estimate suppressed due to RSE > 30%
^	RSE between 25% and 30%
@	Estimate suppressed due to preventing back calculation
-	0; no respondents selected this response option

# General Information about this Child
