

# Partnership Opportunities for Source Water Protection

*Joy Archuleta*  
*R6 Water Quality and Water Rights  
Program Manager*

**October 28<sup>th</sup>, 2020**

***USDA Forest Service***

# National Forest System Lands

154 National Forests

20 National Grasslands

193 million acres

44 states & Puerto Rico

57,000 miles of stream

400,000 lake acres

7.2 million wetland acres

**Provide 20% of America's clean water supply**

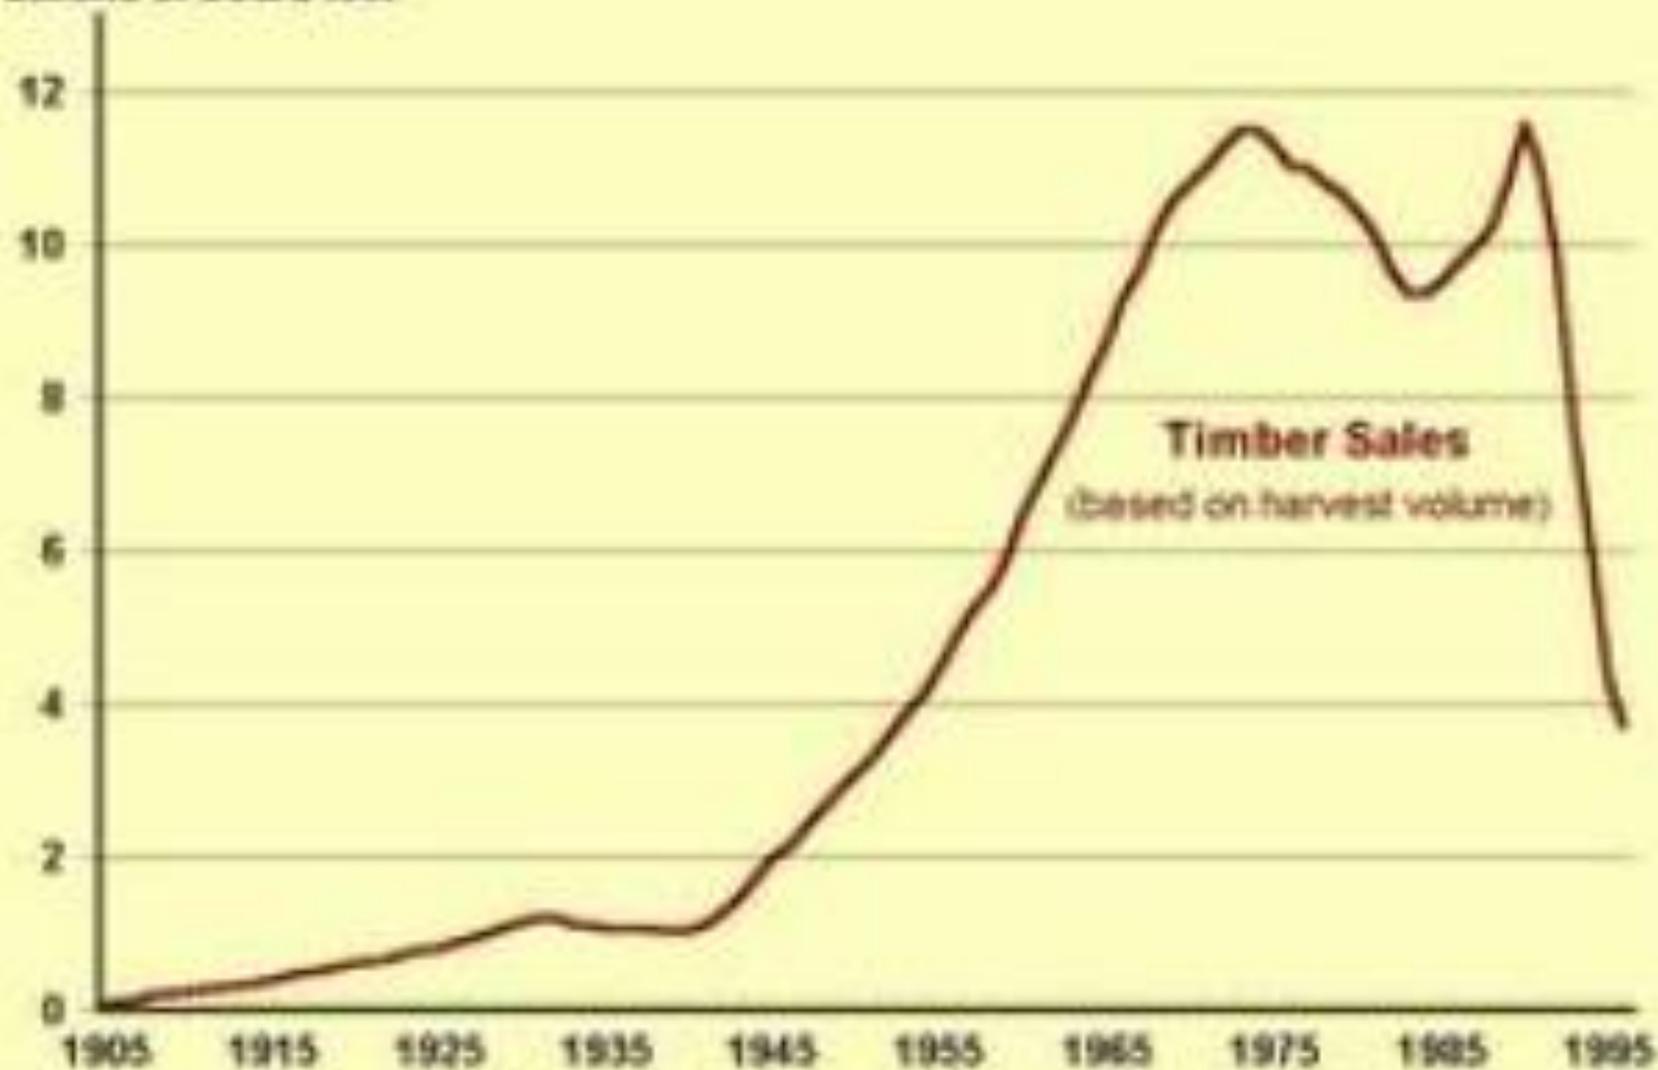

# Brief History of the US Forest Service

**The Organic Administration Act of 1897, under which most national forests were established, states:**

"No national forest shall be established, except to improve and protect the forest within the boundaries, or for the *purpose of securing favorable conditions of water flows, and to furnish a continuous supply of timber* for the use and necessities of citizens of the United States..."

# Historic National Forest Timber Sale Levels

billions of board feet

**Timber Sales**  
(based on harvest volume)

Timber sale board are based on milling average harvest volume from 1988 through 1990.  
Conversion from cubic feet to board feet measure are approximate.  
Data Source: USDA Forest Service "Cut & Saw Reports"

Resource	Treatments	Benefits
Forest Health and Climate Resilience	<ul style="list-style-type: none"> <li>• Wildland/urban interface readiness</li> <li>• Insect &amp; disease treatments</li> <li>• Reforestation</li> </ul>	<ul style="list-style-type: none"> <li>• Reduction in wildfire risk</li> <li>• Reduce fire threat to infrastructure</li> <li>• Protect habitat and recreation values</li> <li>• Improve carbon storage</li> </ul>

Legacy Impacts	<ul style="list-style-type: none"> <li>• Dam removal or improvement</li> <li>• Abandoned mine reclamation</li> <li>• Acid drainage treatment</li> </ul>	<ul style="list-style-type: none"> <li>• Reduce leaching of heavy metals,</li> <li>• Improve aquatic ecosystem</li> <li>• Stabilize soil and improve water storage</li> <li>• Reduce cyanobacterial bloom risks</li> </ul>

# How to Partner with the USFS

- Contact local forests directly
- Schedule of Proposed Actions (SOPA)
- Join collaborative groups
- Work through Regional Partnership Coordinator

# McKenzie Watershed Conservation Fund: Pure Water Partners

## Eugene Water and Electric Board Partnership with the Willamette National Forest

- **payments** to private landowners to maintain high quality riparian areas
- **partnerships** to restore degraded areas
- **green infrastructure** for stormwater management and carbon offsets
- **Willamette National Forest** collaboration through stewardship contracting

# Just good business....

## Economic Analysis of the Pure Water Partners Program

On average, each acre of healthy riparian forest protected through the program results in an **\$438 economic benefit/yr.** with a **260% return on investment** over 20 years.

PREPARED FOR

EWEB

# Innovative Financing for Source Water Protection

## Forest Resilience Bond

- Leveraging capital up-front to increase the pace and scale of restoration
- Quantifying benefits to multiple beneficiaries for shared investments

## Water Funds

- Collective-action platforms
- Strategic planning and blended financing

## Voluntary Surcharge Programs

- Small donations / user fees that can be invested in green infrastructure

## Innovative Finance for National Forests Grant Program

- Development, refining, and scaling of conservation finance models
- Utility partnerships
- [www.ifnfgiants.org](http://www.ifnfgiants.org)

# Drinking Water Providers Partnership

Grant for environmental conservation and restoration projects in municipal watersheds across the Northwest.

## Goals:

- Restore and protect the health of watersheds which communities depend upon for drinking water while also benefiting aquatic and riparian ecosystems, including the native fish that inhabit them.
- Support local partnerships between drinking water providers, landowners, and restoration practitioners.
- **Applications are due by 5:00PM PST on 8 January 2021.**

## Why Forests to Faucets?

Our nation relies on forested watersheds for high-quality drinking water. The National Forests to Faucets 2.0 (F2F2) Assessment is a geographic analysis done by scientists in the US Forest Service that uses biophysical and demographic data to show relative importance of sub-watersheds for surface drinking water and to look at potential threats to those watersheds.

The F2F2 Assessment compares sub-watersheds across the country to show which are most relied upon as sources of drinking water and which are threatened. Threats to these important forested watersheds include fire, insects and disease, development, and reduced run-off due to a changing climate.

### Explore the F2F2 Assessment

Use the links below or the corresponding tabs at the top of the page to explore the relative importance of sub-watersheds for surface drinking water; the potential threats to those watersheds (fire, insects and disease, development, reduced run-off due to changing climate); and the biophysical and demographic data supporting the assessment.

#### Important Watersheds

Relative importance of watersheds for surface drinking water.

#### Risks to Surface Drinking Water

This section displays the relative importance of each sub-watershed for surface drinking water. Locate the sub-watershed(s) of interest to you and determine the extent to which their current status is threatened.

#### Explore Inputs

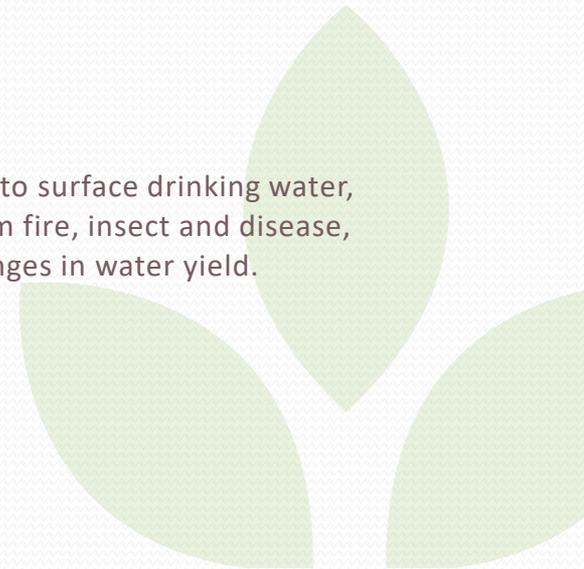

Explore an interactive web map displaying the biophysical and demographic parameters supporting the assessment.

# Forest to Faucet Analysis Objectives

- **OBJECTIVE 1**  
**ABILITY TO PRODUCE CLEAN WATER**  
Assess subwatersheds across the continental US to identify those with the natural ability to produce clean water based on its biophysical characteristics(APCW)
- **OBJECTIVE 2**  
**IMPORTANCE TO SURFACE DRINKING WATER**  
Assess subwatersheds across the US to identify those important to surface drinking water (IMP)
- **OBJECTIVE 3**  
**IDENTIFY IMPORTANT FORESTS**  
Identify forest areas that protect surface drinking water
- **OBJECTIVE 4**  
**ANALYZE RISKS**  
Analyze potential risks to surface drinking water, present and future from fire, insect and disease, development, and changes in water yield.

## Objective 1:

### ABILITY TO PRODUCE CLEAN WATER (APCW)

$$APCW = (N + A + I + R) * Q$$

where

N = Percent Natural Cover

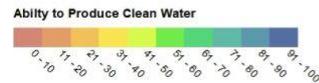

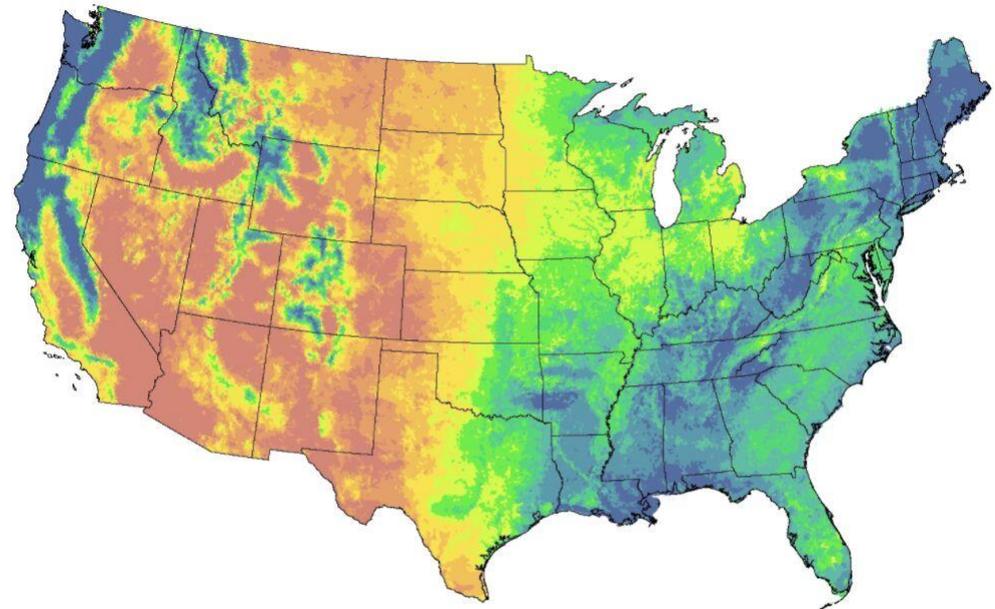

A = Percent Agricultural land

I = Percent Impervious

R = Percent Riparian natural cover

Q = Mean Annual Water Yield

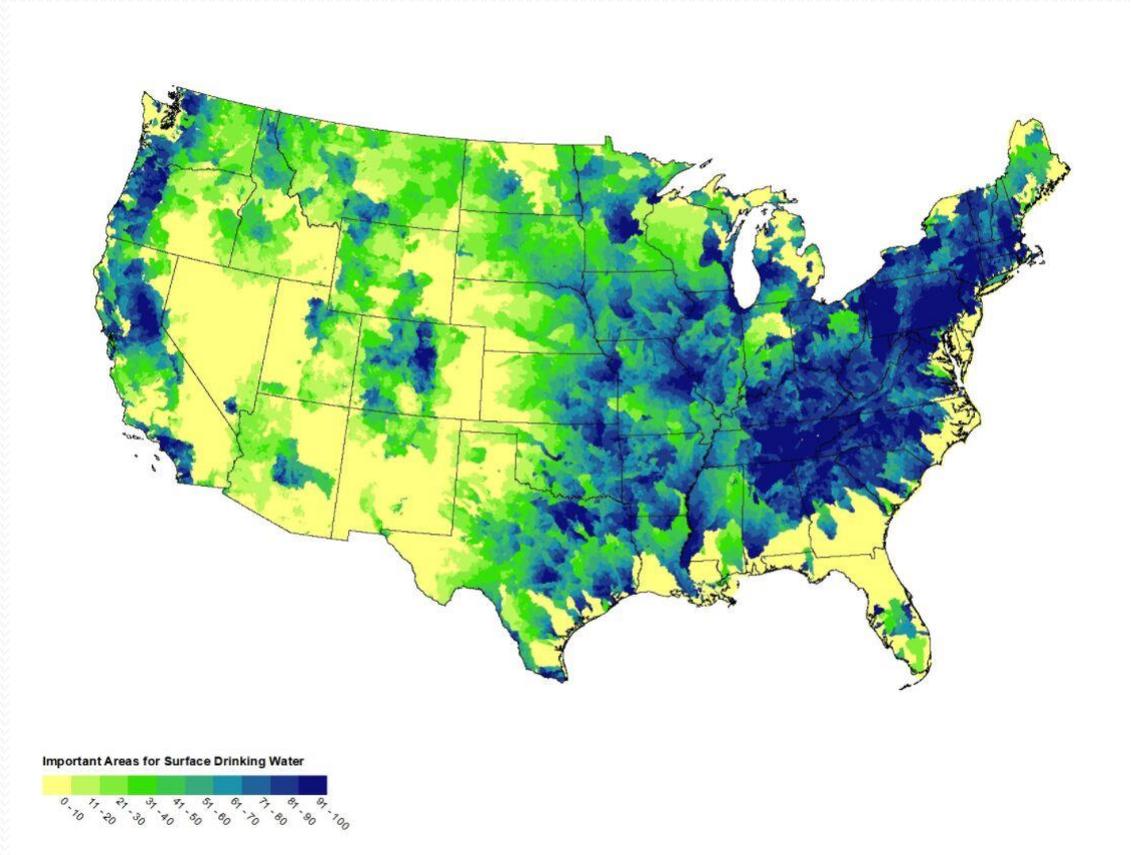

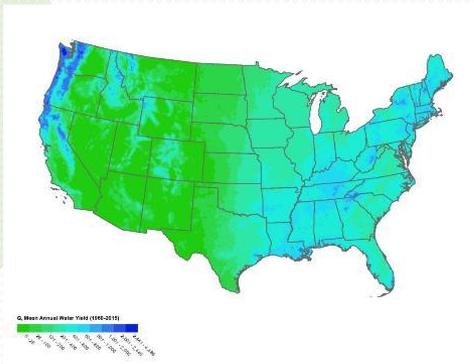

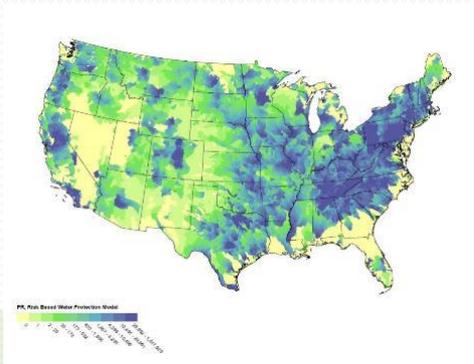

Ability to Produce Clean Water (APCW)				
Rating→	Very High	High	Moderate	Low
↓Attribute	(4 points)	(3 points)	(2 points)	(1 point)
N = Percent Natural Cover	>75	50-75	25-50	<25
A = Percent agricultural land	<10	10-20	21-30	>30
I = Percent Impervious	0-1	1-5	5-10	>10
R = Percent riparian natural cover	>70	51-70	30-50	<30
Q = Mean annual water yield	>800 mm	400-800 mm	200-400 mm	0-200 mm
Ability to Produce Clean Water (APCW)	$(N + A + I + R) * Q = APCW$			

## OBJECTIVE 2:

### RELATIVE IMPORTANCE TO SURFACE DRINKING WATER (IMP)

$$\text{IMP} = Q_n * \text{PR}_n$$

## **OBJECTIVE 3: IDENTIFY FOREST AREAS THAT PROTECT SURFACE DRINKING WATER**

This analysis highlights the relative importance of:

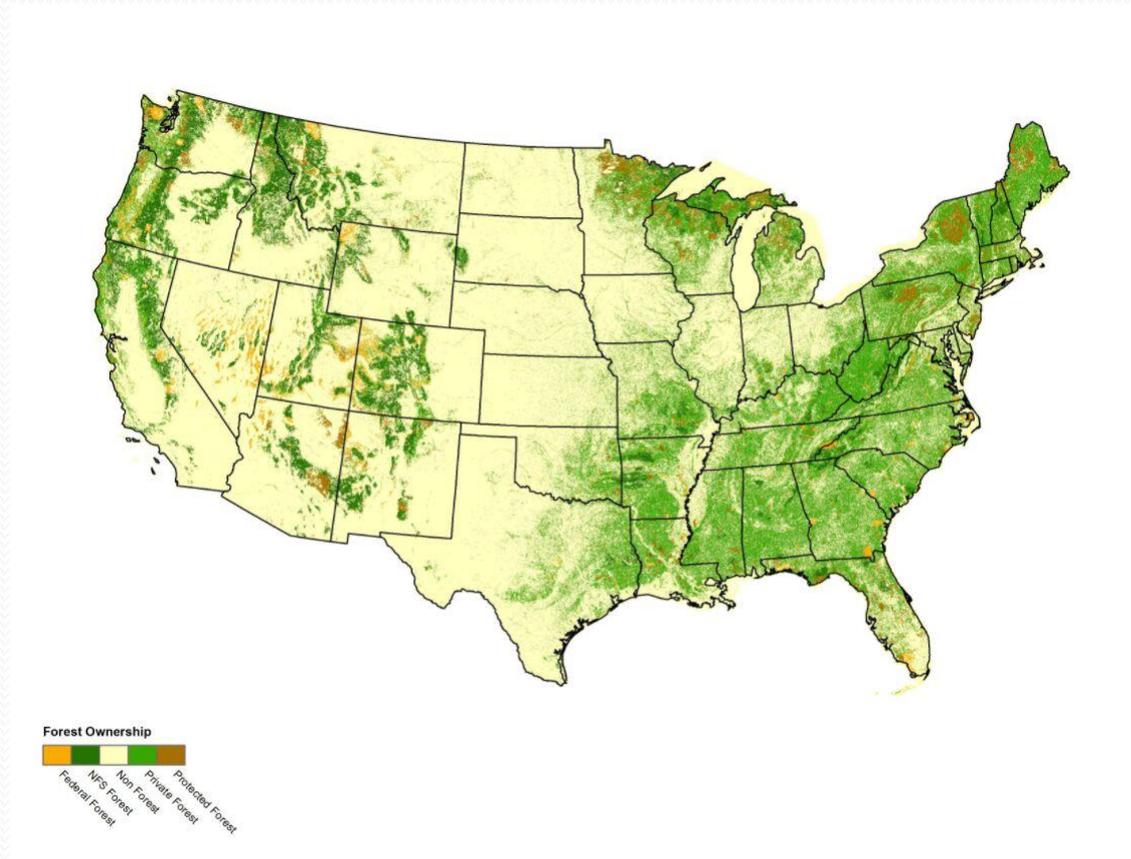

- a) all forest lands,
  - b) National Forest system lands,
  - c) other Protected lands
- and
- d) unprotected private forest lands.

# Objective 4: IDENTIFY SUBWATERSHEDS WHERE RISKS AFFECT SURFACE DRINKING WATER.

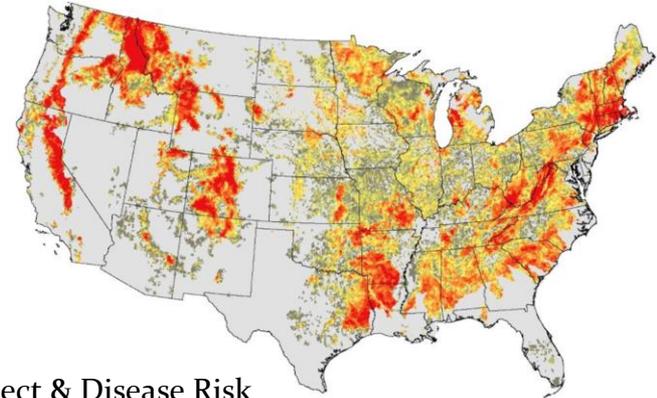

Wildfire Risk

Wildfire Risk in Important Surface Drinking Water Watersheds

1-10	11-20	21-30	31-40	41-50	51-60	61-70	71-80	81-90	91-100
------	-------	-------	-------	-------	-------	-------	-------	-------	--------

Lowest Risk

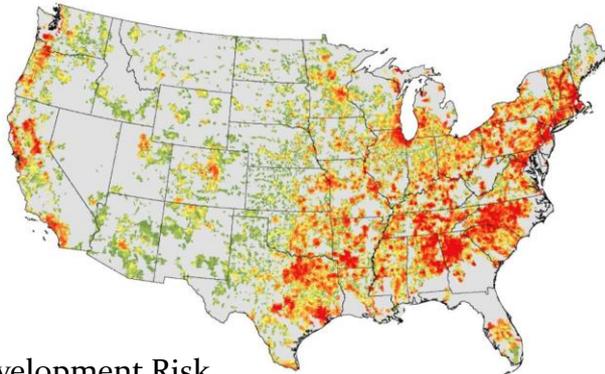

Insect & Disease Risk

Insect & Disease Risk in Important Surface Drinking Water Watersheds

1-10	11-20	21-30	31-40	41-50	51-60	61-70	71-80	81-90	91-100
------	-------	-------	-------	-------	-------	-------	-------	-------	--------

Lowest Risk

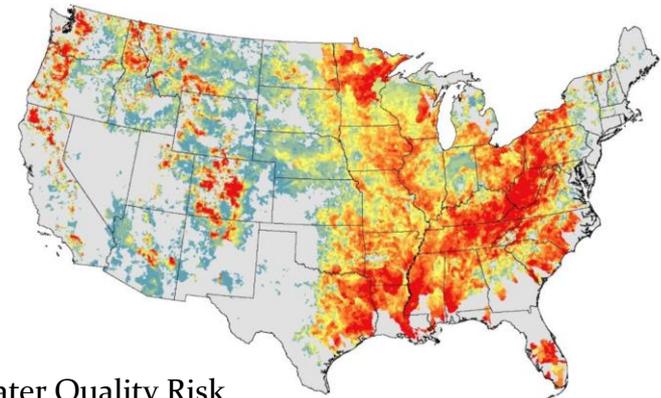

Development Risk

Development Risk in Important Surface Drinking Water Watersheds 2010-2090 (High Emissions)

1-10	11-20	21-30	31-40	41-50	51-60	61-70	71-80	81-90	91-100
------	-------	-------	-------	-------	-------	-------	-------	-------	--------

Lowest Risk

Water Quality Risk

Water Quality Risk in Important Surface Drinking Water Watersheds 2010-2090 (High Emissions)

1-10	11-20	21-30	31-40	41-50	51-60	61-70	71-80	81-90	91-100
------	-------	-------	-------	-------	-------	-------	-------	-------	--------

Lowest Risk

## How can the Forest to Faucets application be useful to Water Managers?

By identifying source water areas upstream from drinking water intakes that:

- Have a natural ability to produce clean water based on biophysical characteristics
- Have consumer demand for the water produced
- Are facing significant threats (development, insects and disease, and wildland fire).

Using this information priority areas for restoration and/or conservation can be identified for further analysis.
