Wildfire Smoke

LOCAL PUBLIC HEALTH OFFICERS

Guidance for Canceling Outdoor Events or Activities and Closing Schools

May 2024
Introduction

The Washington state departments of Health and Ecology have been asked about when to cancel outdoor events and activities or close schools due to wildfire smoke impacts on public health. Decisions about closures, relocations, or evacuations are made at the local level in Washington. This document provides guidance for local health officers about air concentrations of smoke, measured as fine particulate matter (PM$_{2.5}$), considered a health threat.

Recommended particulate matter action levels for closures and cancellations

When the current or forecasted outdoor AQI for PM$_{2.5}$:

- Equals or exceeds an AQI value of 101 (“Unhealthy for Sensitive Groups” category or worse), modify duration or limit intensity of children and youth outdoor activities, move them to an area with safer air quality, or consider canceling depending on the length of the activity.

- Equals or exceeds an AQI value of 151 (“Unhealthy” category or worse), cancel children and youth outdoor activities or move them to an area with safer air quality. Consider canceling outdoor public events and activities.

- Equals or exceeds an AQI value of 201 (“Very Unhealthy” category or worse), cancel outdoor public events and activities.

When school is in session and indoor PM$_{2.5}$ concentrations:

- Equal or exceed 125.5 µg/m$^3$ (indoor equivalent to AQI value 201 and “Very Unhealthy” category or worse), discuss school closure with administrators.

CURRENT AIR QUALITY & FORECASTS

Current outdoor PM$_{2.5}$ levels from agency monitors are available as Air Quality Index (AQI) Values that are updated hourly on the Washington Smoke Blog and EPA’s AirNow App. Forecasts are also increasingly available during wildfire season on the WA Smoke Blog and Washington State Department of Ecology’s Smoke Forecast website. Low-cost PM$_{2.5}$ sensors can provide helpful information outdoors where there is not a nearby agency monitor and indoors, where there are no agency monitors, though these are less accurate than agency monitors and uncorrected sensor measurements should not be directly compared to PM$_{2.5}$ action levels. Publicly reported PM$_{2.5}$ outdoor sensor measurements with an applied smoke correction factor are also available on the WA Smoke Blog.

CURRENT AIR QUALITY & FORECASTS

Current outdoor PM$_{2.5}$ levels from agency monitors are available as Air Quality Index (AQI) Values that are updated hourly on the Washington Smoke Blog and EPA’s AirNow App. Forecasts are also increasingly available during wildfire season on the WA Smoke Blog and Washington State Department of Ecology’s Smoke Forecast website. Low-cost PM$_{2.5}$ sensors can provide helpful information outdoors where there is not a nearby agency monitor and indoors, where there are no agency monitors, though these are less accurate than agency monitors and uncorrected sensor measurements should not be directly compared to PM$_{2.5}$ action levels. Publicly reported PM$_{2.5}$ outdoor sensor measurements with an applied smoke correction factor are also available on the WA Smoke Blog.
PM$_{2.5}$ concentrations are reported across six health hazard levels in the AQI. The PM$_{2.5}$ action levels described here are each at a cut-point of a hazard level. The AQI is designed for outdoor pollutants, though the school closure action level is based on an indoor PM$_{2.5}$ concentration with an equivalent AQI value in the absence of established hazard levels for the general public designed for indoor use.

Modify duration or limit intensity of children and youth outdoor activities, move them to an area with safer air quality, or consider canceling depending on the length of the activity.

Cancel children and youth outdoor activities or move them to an area with safer air quality. Consider canceling outdoor public events and activities.

Cancel outdoor public events and activities.

Discuss school closure with administrators.

Factors to consider for cancelling outdoor events and activities, and closing schools

In addition to the PM$_{2.5}$ action levels, consider other factors and issues specific to your area when deciding about closures and cancellations to protect health and welfare.

Outdoor Events and Activities

- What is the forecast for how long wildfire smoke levels will remain high?
- Are smoke conditions getting worse, getting better, or staying about the same?
- Is there an option to relocate to an area with cleaner air?
- If children or others requiring care are involved, will adults be available as caretakers?
- Will there be impacts on economic or job security by canceling the activity or event?
- Are there other weather factors to consider, like excessive heat or humidity, that would further increase risk from outdoor exposure?
- Is the visibility safe for driving?

## Schools
- What is the forecast for how long wildfire smoke levels will remain high?
- Have all options to improve indoor air quality been attempted?
- Are students and staff who are sensitive to smoke allowed to stay home if it is safer?
- Is it safe to walk or bike to school?
- Is the visibility safe for driving?
- Are there other weather factors to consider, like excessive heat or humidity, that would further increase health risks?
- Where will children be relocated if schools are closed? Is the air quality better there?
- If children or others requiring care are involved, will adults be available as caretakers?
- Will there be impacts to economic or job security for parents missing work to attend to children?
- While moving to another location, will people be more exposed outdoors than if they had just stayed indoors?
- Are there other safety concerns about relocating people?

## Steps to reduce smoke exposures
- Reduce outdoor time and activities.
- Stay indoors and keep indoor air as clean as possible.
- Keep windows closed and only allow entry of outside air through filtration.
- Restrict use of outside doors; double door entries can help keep smoke out.
- Wildfires often occur on hot days, and many schools and other indoor facilities do not have air conditioning. Pay attention to the heat and take steps to cool buildings.

## Measuring wildfire smoke levels
The concentration of PM$_{2.5}$ – particles less than 2.5 micrometers in diameter – is the most useful measurement of smoke levels to protect health. The Department of Ecology (Ecology), local clean air agencies, and Tribes routinely monitor these levels outdoors. PM$_{2.5}$ concentrations are grouped into health hazard levels within the U.S. Environmental Protection Agency’s (EPA) Air Quality Index (AQI) six categories (Figure 1). Health precautions in each category are based on current conditions weighted to “24 hour-like” average concentrations. AQI values are from hourly monitored concentrations using EPA’s NowCast algorithm.

NowCast particulate matter (PM$_{2.5}$) concentrations use averages of between 3 and 12 hours that can be compared to 24-hour standards and health indexes. EPAs’ NowCast algorithm is designed to respond when air quality conditions are rapidly changing, which is common during...
wildfire smoke events. NowCast concentrations use longer averaging times when air quality is stable, and shorter averaging times when conditions are changing quickly. NowCast concentrations, unlike hourly data, are suitable for comparison with federal standards and the AQI.

**Outdoor measurements, trends and forecasts**

Three key pieces of information about smoke conditions are available on public agency websites and apps: the current PM$_{2.5}$ AQI, current PM$_{2.5}$ trends (whether smoke conditions are getting worse, getting better, or staying the same), and smoke forecasts. Whenever possible, decision-making around canceling outdoor events and activities, closing facilities or relocating people should consider all three pieces of information. Forecasts more than two days in the future should be used with caution, as they have greater uncertainty.

The Washington Smoke Blog is the recommended public agency website for accessing information on current conditions, trends, and forecasts, as it provides all three in a single map. On a smartphone, EPA’s AirNow is the recommended app, though its forecasts are limited to most parts of Washington. Users who do not see forecast information in their area on the AirNow app can also refer to Ecology’s smoke forecast, which covers the whole state. Instructions for all these resources are provided below.

**Outdoor Air Sensors**

The recommended maps show agency monitoring sites as larger circles, temporary monitors as medium-size circles, and publicly reporting PM$_{2.5}$ low-cost sensors as smaller circles. Low-cost PM$_{2.5}$ sensors are small devices available commercially. They are generally less accurate than agency monitors, and since many are operated by members of the public, their performance, siting, and maintenance are unknown. Though EPA conducts some limited quality control screening on sensor data and applies a correction factor to account for known sensor bias, sensor data has greater uncertainty and is generally lower quality than agency monitoring data.

Where available, nearby agency monitors are the best data source. However, agency monitors may also represent different smoke conditions if they are at a different elevation or in a different type of environment. In places far from agency monitors, nearby air sensors are likely better data sources than distant agency monitors. However, sensor data should be interpreted with caution, especially when one sensor shows very different values than other nearby sensors. Considering values from multiple nearby sensors can help offset the greater uncertainty of sensor measurements.

**Recommended Website: Washington Smoke Blog**

To see the current PM$_{2.5}$ AQI and trend using the Washington Smoke Blog map:

- Click the agency monitor or sensor closest to the area of interest.
A pop-up will appear that indicates the PM$_{2.5}$ AQI value, trend, and link to recommended health actions.

Additional features shown on the map include: fire icons for large fire incidents, small glowing points for satellite fire detections, and gray polygons for smoke plume locations.

*Figure 2. Washington Smoke Blog map pop-up*

*Note: Though the design of EPA’s Fire and Smoke map will change in 2024, the three main elements of the map – current conditions, forecast, and trends – will all remain available.*

To see the smoke forecast:

- Close any visible pop-ups on the map.
- Under “Select Forecast Date” in the top left corner of the map, use the slider to advance the date to the desired forecast date.
- The shaded polygons on the map indicate the 24-hour PM$_{2.5}$ AQI category forecasted for the selected date.
The Washington Smoke Blog also contains text and graphical discussions of statewide, regional, or local air quality forecasts when wildfire smoke events are in progress. The Monitoring and Forecasting tab on the blog contains more information on several available higher-resolution smoke simulations.

Recommended Smartphone App EPA’s AirNow

The landing page of EPA’s AirNow app shows the current AQI and the daily forecast for some areas. Sometimes the current AQI is based on ground-level ozone or PM$_{10}$ conditions instead of PM$_{2.5}$. Click “Details” below the AQI dial to see the AQI value for PM$_{2.5}$.
For more detailed monitoring data, click the “Smoke” button in the bottom right corner of the app. This map shows the same display of agency monitors and air sensors visible on the Washington Smoke Blog map.

- Click the agency monitor or sensor closest to the area of interest.
- A pop-up will appear that indicates the PM$_{2.5}$ AQI value, trend, and link to recommended health actions.
Alternative Smartphone App: Ecology AirQualityWA Web Application

Ecology’s air monitoring webpage is a progressive web application. It can be saved as a shortcut on a smartphone home screen and will behave like a smartphone app. It shows the current AQI and graphs of recent AQI conditions. The smoke forecast will be added with a toggle button in early summer 2024. As new features will be added to the web application throughout 2024, screenshots below may not be current.
Figure 6. Home screen of Ecology’s AirQualityWA web application (left) and example site popup (right).

Select a site by clicking the map to see its AQI and trend graph. Click the graph icon on the popup (circled in red in the screenshot above on the right) to access site details.
For app-like functionality, the web application can be saved to a smartphone home screen. Users who reference one monitoring site frequently may choose to save that site’s details page rather than the map itself for quick access.

To save the web application to a smartphone, select the share button and choose “Add to Home Screen.” On an iPhone using Safari, this is the button with a square and a vertical arrow as shown in red below. On an Android phone using Chrome, open the menu using the three dots in the top right.
Other websites and apps

PM$_{2.5}$ AQI values, trends and smoke forecasts are also available from other public agency websites and apps. The information from these resources and instructions for viewing the PM$_{2.5}$ AQI are summarized in Table 1 below.
A number of private companies also provide AQI values and forecasts through websites and apps, including popular weather apps. While some pull this information from EPA, others use proprietary methods that are not always accurate or transparent, and some use AQI breakpoints incorrectly. The public agency websites and apps listed above are recommended over private or third-party websites and apps to ensure that users have the most accurate information on smoke conditions and forecasts.

Indoor PM$_{2.5}$ Measurement in Schools

Low-cost PM$_{2.5}$ sensors can provide helpful information about indoor air quality in making decisions about school closures and school activities. While sensor measurements are less accurate than those from agency monitors, there are no agency monitors indoors, and correction factors can sometimes be used to increase accuracy. If using a correction factor is not possible, do not directly compare uncorrected sensor data to AQI breakpoints or PM$_{2.5}$ action levels. Instead, use sensor data to check how different parts of the school compare to each other and how indoor PM$_{2.5}$ levels compare to outdoor levels. When comparing indoors to outdoors, ensure both measures are uncorrected or using the same correction factors. Uncorrected sensor data can still indicate whether indoor concentrations are lower or higher than outdoor concentrations and whether some indoor spaces are cleaner than others.

Two strategies are helpful in evaluating indoor PM$_{2.5}$ levels in schools during periods of wildfire smoke.

1. Assess variation in indoor air quality, ventilation, and filtration throughout the building(s) of the school:
   - Conduct a walk-around of the building(s) and outdoors using a portable sensor when outside PM$_{2.5}$ levels reach “Unhealthy for Sensitive Groups” (AQI value ≥ 101). Do this during times when the building is in use and ventilation is in normal operating conditions.
   - Select rooms where indoor air quality and ventilation, as well as children’s activity levels are expected to vary. Include rooms used by children that are expected to have worse ventilation or indoor air quality (like no air filtration), rooms where physical activity is usually more vigorous (like the gym), rooms where external doors are opened frequently, and any external buildings (like portables).
   - In each room and outdoors, let the sensor measurements stabilize, then estimate average measurements over 5 to 10 minutes.
   - Complete the walk-around while outside PM$_{2.5}$ levels are stable, likely best achieved by completing within a few hours.
   - Determine the relative difference across the building(s) compared to outside PM$_{2.5}$ levels. For example, if the gym’s indoor PM$_{2.5}$ level is 75 µg/m$^3$ and the outdoor PM$_{2.5}$ is 100 µg/m$^3$, then there is a 25% reduction of outdoor air pollution in the gym. If a regular classroom’s indoor PM$_{2.5}$ level is 50 µg/m$^3$ and the outdoor PM$_{2.5}$ is 100 µg/m$^3$, then there is a 50% reduction of outdoor air pollution in the classroom. This suggests that the classroom would have cleaner air than the gym.
   - Prioritize steps to reduce exposure in the rooms with highest PM$_{2.5}$ levels or relocate children away from these rooms to cleaner air spaces if necessary.
   - If possible, repeat the walk-around throughout the poor air quality or smoke event. Also repeat the walk-around as needed if outside PM$_{2.5}$ levels increase or operating conditions change that would impact ventilation or indoor air quality. For example, if
portable air cleaners are added, if windows cannot be kept closed, or if there are major changes in how the rooms are being used.

2. Track indoor air quality during wildfire smoke events:

- Place a stationary sensor in a room that is representative of the indoor air quality of the building(s) that has typical building use, and/or in a space with high physical activity levels or where students would go for indoor recess (like the gym). Avoid the cafeteria, where there are often sources of indoor PM$_{2.5}$ from cooking.

- When outdoor PM$_{2.5}$ levels reach “Unhealthy for Sensitive Groups” (AQI value ≥ 101):
  - For school activities including games or practices, check the trend of indoor PM$_{2.5}$ concentrations over time (i.e. whether smoke conditions are getting worse, getting better, or staying the same).
  - For decisions about school closures, check the one-hour averages of indoor PM$_{2.5}$ concentrations over a period of 3 hours or more, and consider the forecast of outside PM$_{2.5}$ for the day.

- Compare indoor stationary sensor measurements to outdoor stationary sensor measurements (ensure that either both are uncorrected or they have the same correction factor). Then apply this comparison to the nearest agency monitor. For example, if the indoor stationary sensor measurements are half of the outdoor stationary sensor measurements, assume that the indoor PM$_{2.5}$ concentrations are half of what the agency monitor is reporting. If there is no outdoor stationary sensor, refer to the assessment from the walk-around (above) to determine the relative difference between the room with the indoor stationary sensor and outdoors (Figure 9). If there is no nearby agency monitor, consider installing a publicly reporting outdoor stationary sensor that could show up on the [EPA Fire and Smoke Map](https://www.cwa.gov/air-quality/fire-and-smoke-map) with a correction factor applied. Currently, outdoor Purple Air sensors are displayed on the EPA Fire and Smoke Map. Other sensors may also be included on the map in the future.

- Refer to the assessment from the walk-around (above) to determine relative estimates of the PM$_{2.5}$ levels in other rooms throughout the building(s) compared to the room with the indoor stationary sensor.

- Prioritize efforts on reducing PM$_{2.5}$ levels in the rooms with highest levels or relocate children away from these rooms to cleaner air spaces if necessary.
Check the performance evaluations developed by South Coast AQMD when selecting low-cost PM$_{2.5}$ sensors. A Field $R^2$ value near 1 and a relatively low Field MAE indicate a better-performing sensor, though even data from better-performing sensors may still need a correction factor applied to correct bias. Note that EPA’s Fire and Smoke Map displays publicly reporting outdoor sensors (such as Purple Air) with a correction factor applied. The Fire and Smoke Map does not show indoor sensors. If you are comparing indoor and outdoor measurements from sensors such as Purple Air, make sure you are comparing uncorrected indoor data to uncorrected outdoor data, or that the two are using the same correction factor. If you’re not sure whether indoor PM$_{2.5}$ levels are lower than outside, assume levels are similar and take precautionary steps to reduce exposures. For technical assistance with indoor sensor measurements, contact: airquality@doh.wa.gov.

**Other sources of PM$_{2.5}$ air pollution in Washington**

Major sources of PM$_{2.5}$ in Washington are wildfire, dust from tilling and harvesting, agricultural and silvicultural burning, and residential wood burning. Industrial and mobile sources also emit...
PM$_{2.5}$, though in smaller amounts than these other sources. While there is concern about PM$_{2.5}$ from each of these sources of pollution, the chemical compositions can differ, and this can affect toxicity. There are also different seasonal patterns. For example, residential wood burning generally occurs over several months and contributes to routinely high PM$_{2.5}$ concentrations, particularly during cold and stagnant weather. In contrast, wildfire smoke tends to last for a few weeks and the PM$_{2.5}$ concentrations can have very high daily peaks. Some of the highest acute exposures to air pollution in Washington are from wildfire smoke.

Health Concern of Smoke Exposures

Exposure to wildfire smoke, like all smoke, can cause health problems. Minor symptoms include burning eyes, runny nose, coughing, and headaches. More severe effects include asthma attacks, COPD flare-ups, abnormal heart rhythms, heart attacks, and strokes. Several epidemiologic studies focusing on health impacts of wildfire smoke have been published recently, with just a few specific to Washington.

A study of Washington wildfire smoke impacts from fires in 2012 found that for a 10 µg/m$^3$ increase in PM$_{2.5}$ from wildfire smoke there is a 5% increased risk in same-day respiratory hospitalizations (odds ratio 1.052, 95% confidence interval 1.025-1.080) (Figure 10) [1]. The study found that, when focusing on specific respiratory impacts, there is an 8% increased risk for same-day asthma-related admissions for a 10 µg/m$^3$ increase in PM$_{2.5}$ from wildfire smoke (odds ratio 1.076, 95% confidence interval 1.019-1.136) [1].

Figure 10. Hospital admissions—wildfire smoke

Hospital admissions classified as emergency or urgent care associated with wildfire smoke exposures for a 10 µg/m$^3$ increase in PM$_{2.5}$ from wildfire smoke in Washington in 2012. Includes lag analysis (0-5 days).

Figure adapted from Gan et al. 2017; results limited to GWR estimation of smoke [1]

The state Department of Health (Health) collaborated with several local health jurisdictions in central Washington to examine emergency department and outpatient clinic visits during 2012
wildfires. Health found that average daily patient visits were 28% higher for cardiovascular disease and 18% higher for respiratory disease during wildfires, compared to the two-week period before wildfires [2]. The increased daily patient visits were most pronounced for respiratory disease in children [2].

A University of Washington study in collaboration with the departments of Ecology and Health investigated mortality and wildfire smoke in Washington from 2006 to 2017 [3]. The risk of dying from all non-traumatic deaths (i.e. not including accidents) was found to increase 2% the day after wildfire smoke compared to days without wildfire smoke. The increase remained two days after the smoke but was no longer statistically significant. As a sub-analysis, the risk of dying on the day of wildfire smoke was generally higher when focusing on respiratory causes of death.

A University of Washington study examined emergency department visits and wildfire smoke in Washington from 2017 to 2020 [4]. The risk of asthma emergency department visits increased 13% on the day of wildfire smoke exposure compared to days without wildfire smoke. This increase remained for the following five days. The risk of respiratory emergency department visits was also elevated on the five days following initial exposure. The study found mixed results for cardiovascular-related emergency visits by age group.

People with increased risk of adverse health effects when smoke levels are high include people with heart and lung diseases, people with respiratory infections, people with diabetes, people 18 and younger or older than 65, pregnant people, people living with disabilities, people who smoke, outdoor workers, people of color, Tribal members and Indigenous people, and people with low-income. For wildfire smoke and other air pollution exposures, a smaller portion of the population will suffer from the most severe health impacts, such as death and hospitalizations, and a larger portion of the population will suffer subclinical effects (headache, cough, eye irritation, and so on). The most severe impacts first occur in sensitive populations. However, as wildfire smoke exposures increase, more of the public will start to experience these severe impacts (Figure 11).
Increasing evidence suggests that PM$_{2.5}$ from wildfire smoke may be more toxic than PM$_{2.5}$ from other sources [6], and that exposure to wildfire smoke is not experienced equally [7-9]. Most epidemiologic research of wildfire smoke focuses on acute health effects that occur within a week of elevated 24-hour PM$_{2.5}$ exposures. There is growing consensus that short-term exposure to wildfire smoke increases the risk of all-cause mortality, respiratory morbidity, including asthma and COPD exacerbations, and mixed evidence for cardiovascular morbidity [10]. Additionally, increasing evidence suggests short-term wildfire smoke exposure may be associated with adverse birth outcomes [11], and mental health impacts [12]. There is also evidence suggesting that wildfire smoke exposure increases the risk of respiratory infection, including for influenza [13], and for COVID-19 cases and mortality [14, 15]. In scenarios of short-term exposure to wildfire smoke, most people will likely recover a few weeks after inhalation of wildfire smoke. However, there may be some residual physical damage; thus, everyone should take steps to reduce exposure during wildfire smoke events. However, communities in Washington are increasingly experiencing long-term exposure to wildfire smoke, combined with other smoke sources, such as residential wood burning and agricultural burning. There is a very limited body of research on long-term health effects of wildfire smoke exposure, indicating an increase in mental health impacts [16].

There is a much larger body of published research about PM$_{2.5}$ exposures from other sources of air pollution beyond wildfire smoke, and outside of Washington. Meta-analyses combining the results of several studies demonstrate that short-term increases in PM$_{2.5}$ from a wide range of sources are associated with higher rates of deaths and hospitalizations [17, 18]. Many of these deaths and hospitalizations are due to cardiovascular and
respiratory effects. Increased cardiovascular hospitalizations include congestive heart failure and ischemic heart disease [19]. Underlying respiratory diseases that are worsened include asthma, chronic obstructive pulmonary disease (COPD) and pneumonia [19]. In adults and children, research indicates that elevated exposures to PM$_{2.5}$ leads to poor lung function [20, 21]. Exposure to PM$_{2.5}$ in children may not only worsen asthma, but may lead to development of asthma [22]. While worsening heart and lung effects from PM$_{2.5}$ exposure have been studied the most, there is increasing evidence that PM$_{2.5}$ may also lead to several other effects, such as strokes [23], development of type 2 diabetes [24, 25], neurological and cognitive impairment [26, 27], and poor birth outcomes like pre-term delivery or babies born with low birth weight [28, 29]. Though there is less research about these impacts specific to wildfire smoke PM$_{2.5}$ exposures, the pattern of impacts appears similar to or worse than that of PM$_{2.5}$ from other sources.

## Washington Guide for Public Health Actions for Wildfire Smoke

This guide is designed for air quality, public health, and other officials making local decisions.

### Air Quality Index

<table>
<thead>
<tr>
<th>Index</th>
<th>Recommended Public Health Actions</th>
</tr>
</thead>
</table>
| **Good** (0-50)     | - Coordinate a local plan for public health actions and distribute preparedness information to the public.  
                      - Identify indoor spaces where individuals will seek cleaner air during wildfire smoke events and develop plans to protect indoor air quality, including filtration.  
                        » Indoor spaces used by sensitive groups, such as schools, childcare facilities, and long-term care facilities.  
                        » Community cleaner air settings, such as libraries.  
                        » Temporary cleaner air shelters.  
                      - Monitor wildfires, smoke forecasts, and air quality at [WA Smoke Blog](https://wasmoke.blogspot.com).  
| **Moderate** (51-100) | - Distribute health information to the public, including steps to take with health advisory categories: [Washington Air Quality Guide for Particle Pollution](https://www.doh.wa.gov/HealthyLives/AirQuality/Pages/Smoke.aspx).  
                          » Refer to the WA Smoke Blog for information about wildfires, smoke forecasts, and air quality.  
                          » Identify and focus outreach efforts for sensitive groups.  
                          - Coordinate with public health partners to follow recommended public health actions.  
                          - Recommend following the [Washington Children and Youth Activities Guide for Air Quality](https://www.doh.wa.gov/HealthyLives/AirQuality/Pages/ChildrenYouthActivitiesGuide.aspx).  
                          - For outdoor workers, start following WA Department of Labor and Industries’ requirements.  |
| **Unhealthy for Sensitive Groups** (101-150) | - Recommend sensitive groups take steps to reduce exposure (limit time outside, avoid strenuous outdoor activity, and follow tips for cleaner indoor air).  
                           - Recommend sensitive groups spend time in a cleaner air setting in the community, such as a library, if they cannot maintain cleaner air at home.  
                           - Cancel children’s outdoor athletic events and practices or move them to an area with safe air quality, either indoors or at a different outside location: [Washington Children and Youth Activities Guide for Air Quality](https://www.doh.wa.gov/HealthyLives/AirQuality/Pages/ChildrenYouthActivitiesGuide.aspx).  
                           - For an extended duration of smoke, consider opening a cleaner air shelter for sensitive groups.  |

Washington Air Quality Guide for Particle Pollution

Vehicle exhaust, woodstove emissions, industrial emissions, wildfire smoke, windblown dust, and other sources contain fine particles with diameters 2.5 micrometers or smaller (PM2.5) that can be dangerous to your health.

The Air Quality Index (AQI) reports the level of air quality and health concern across six categories:

<table>
<thead>
<tr>
<th>Air Quality Index</th>
<th>What Should I Do?</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Good</strong> 0–50</td>
<td>It’s a great day to be active outside and a good time to make a plan if worse air quality is in the forecast.</td>
</tr>
<tr>
<td><strong>Moderate</strong> 51–100</td>
<td>Some people are especially sensitive to lower levels of particle pollution and should reduce exposure. For example, limit time outside and avoid strenuous outdoor activity. All sensitive groups should watch for symptoms.</td>
</tr>
<tr>
<td><strong>Unhealthy for Sensitive Groups</strong> 101–150</td>
<td>Sensitive groups should take steps to reduce exposure. Limit time outside, avoid strenuous outdoor activity, and follow tips for cleaner indoor air. Everyone should watch for symptoms as a sign to reduce exposure.</td>
</tr>
<tr>
<td><strong>Unhealthy</strong> 151–200</td>
<td>Everyone should reduce exposure. Limit time outside, avoid strenuous outdoor activity, and follow tips for cleaner indoor air.</td>
</tr>
<tr>
<td><strong>Very Unhealthy</strong> 201–300</td>
<td>Everyone should reduce exposure. Stay inside and filter indoor air to keep it cleaner. Go elsewhere for cleaner air, if needed.</td>
</tr>
<tr>
<td><strong>Hazardous</strong> &gt;300</td>
<td>Everyone should reduce exposure. Stay inside and filter indoor air to keep it cleaner. Go elsewhere for cleaner air, if needed.</td>
</tr>
</tbody>
</table>

See back page for steps to reduce exposure and a list of sensitive groups with increased risk.

Know the symptoms!

- Burning eyes
- Coughing
- Throat and nose irritation
- Headaches
- Fatigue
- Wheezing and shortness of breath
- Irregular heartbeat
- Chest pain

If your symptoms become serious, seek medical attention. High exposure to PM2.5 can lead to hospitalizations and increase the risk of death.

For information on wildfire smoke and protecting health, go to doh.wa.gov/smokefromfires.

For information on wildfire smoke and outdoor worker safety, see WA State Department of Labor and Industries requirements.
Steps to Reduce Exposure

Limit duration and intensity of outside physical activity.

Stay inside with cleaner indoor air:
- Close windows and doors, unless it is too hot to maintain safe temperatures.
- Don’t add to indoor air pollution, such as cigarette smoking or burning candles.
- Filter indoor air through an HVAC system, HEPA portable air cleaner, or DIY box fan filter.
- Set air conditioning to recirculate.

If unable to maintain clean air at home, go elsewhere for cleaner air such as a friend’s place, public space, or unimpacted area.

If you must be outside, wear a properly fitted, NIOSH-approved particulate respirator, such as an N95 mask.

Sensitive Groups with Increased Risk
- People with health conditions
- Lung diseases, such as asthma and COPD
- Heart diseases
- Respiratory illnesses
- Diabetes
- People 18 and younger or older than 65
- Pregnant people
- Outdoor workers
- People of color
- Tribal and indigenous people
- People with low income

For information on wildfire smoke and protecting health, go to doh.wa.gov/smokefromfires.
For information on wildfire smoke and outdoor worker safety, see WA State Department of Labor and Industries requirements.
Figure 14. *Washington Children and Youth Activities Guide for Air Quality*

The following public health recommendations are to protect children and youth (15 years and younger) from fine particle air pollution (PM2.5). Apply this guide to school, child care, athletic practices and games, before and after school programs, camps, field trips, and other outdoor programming and activities.

### Outside Air Quality Index (AQI): PM2.5

<table>
<thead>
<tr>
<th>Activity Duration</th>
<th>Good (0-50 AQI)</th>
<th>Moderate (51-100 AQI)</th>
<th>Unhealthy for Sensitive Groups (101-150 AQI)</th>
<th>Unhealthy, Very Unhealthy, or Hazardous (151+ AQI)</th>
</tr>
</thead>
<tbody>
<tr>
<td>15 mins to 1 hour (e.g., recess, PE classes typically held outside)</td>
<td>No restrictions.</td>
<td>Allow children and youth with health conditions to go out or stay indoors. Limit intensity of activities for these children and youth if needed.</td>
<td>Limit to moderate intensity activities outside. For children and youth with health conditions, further limit intensity or move to an area with safer air quality if needed.</td>
<td>Cancel outdoor activity or move to an area with safer air quality, either indoors or at a different location. Limit to light intensity activities indoors if indoor PM2.5 levels are elevated.</td>
</tr>
<tr>
<td>1-4 hours (e.g., athletic events and practices)</td>
<td>No restrictions.</td>
<td>Allow children and youth with health conditions to go out or stay indoors. Limit intensity of activities for these children if needed.</td>
<td>Limit to light intensity activities or to a 1-hour total duration with moderate intensity activities. If intensity level and time cannot be modified, consider canceling outdoor activity or move to an area with safer air quality, either indoors or at a different location. For children &amp; youth with health conditions, further limit time or intensity if needed.</td>
<td>Cancel outdoor activity or move to an area with safer air quality, either indoors or at a different location. Limit to light intensity activities indoors if indoor PM2.5 levels are elevated.</td>
</tr>
<tr>
<td>&gt; 4 hours (e.g., outdoor school or programming, day camp, overnight camp)</td>
<td>No restrictions.</td>
<td>Move children and youth with health conditions to an area with a different location if needed. Allow children and youth without health conditions to opt out or stay indoors and limit intensity of activities.</td>
<td>Limit to light intensity activities and under 4 hr total duration. If intensity level and time cannot be modified, cancel outdoor activity, or move to an area with safer air quality, either indoors or to a different location. For children and youth with health conditions, further limit time or intensity if needed.</td>
<td>Cancel outdoor activity or move to an area with safer air quality, either indoors or at a different location. Limit to light intensity activities indoors if indoor PM2.5 levels are elevated.</td>
</tr>
</tbody>
</table>

**ADDITIONAL CONSIDERATIONS**

- **Close windows and doors when activities are moved indoors. Pay attention to heat.**
- **Indoor air filtration can reduce elevated levels of indoor PM2.5. See Appendix C. To measure indoor PM2.5 levels, see Appendix B.**
- **Consider time spent in transit in activity duration.**

All children and youth 18 and younger are considered a sensitive group. Health conditions include but are not limited to asthma and other lung disease, heart disease, diabetes, and respiratory infection (e.g., RSY and pneumonia).
<table>
<thead>
<tr>
<th>Sources of PM2.5</th>
<th>The primary sources of PM2.5 are typically wildfire smoke during warmer months and smoke from home heating during colder months, though this varies by location. Other sources include vehicle exhaust, industrial emissions, and prescribed burning.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Children's Health &amp; Increased Risk</td>
<td>Children and youth are more sensitive to health effects from breathing PM2.5 because they breathe in more air than adults for their body weight. This increases their total dose of air pollution. The respiratory system also develops until about age 2. Children and youth with health conditions (including asthma and other lung diseases, heart disease, and diabetes) have a higher risk of emergency department visits and hospitalizations compared to children without health conditions. Children and youth may also be at risk for declines in academic performance, neurodevelopmental problems, and chronic conditions in adulthood.</td>
</tr>
<tr>
<td>Physical Activity</td>
<td>Light Intensity Activities: playing board games, playing catch, and stacking blocks. Moderate intensity Activities: climbing on playground, dodgeball, loughs, gym, gymnastics, hopscotch, light riding a tricycle, bicycle, marching band, moderate or brisk walking, shooting basketballs, softball/baseball, table tennis, volleyball, weight training, and yoga. Vigorous Intensity Activities: aerobic dance, basketball, cheer, competitive swimming, football, jogging, jumping jacks, jump rope, KARATE, race walking, running, soccer, swimming, tennis, and vigorous bicycling. For a more detailed list, see CDC's guidance, Measuring Physical Activity intensity.</td>
</tr>
<tr>
<td>Reducing Exposures</td>
<td>As PM2.5 pollution increases, each action is increasingly important to protect health: Limit duration and intensity of outdoor physical activity (e.g., increase rest periods), stay indoors when possible and keep indoor air clean. Consider a child's total exposure throughout the day and night, including time spent at school, home, and in transit. Walking, biking, or riding in a bus with windows open is time outdoors. Some children may not have cleaner air at home.</td>
</tr>
<tr>
<td>Air Quality Monitoring &amp; Low-Cost Sensors</td>
<td>Outdoor Air Monitoring: Use air pollution forecasts and government agency monitors on AirNow.gov for non-wildfire smoke pollution. Use the WA Air Quality Guide for Particle Pollution. The Smoke Blog includes low-cost sensors and has the most relevant forecasts for Washington wildfire smoke. See Appendix A. Indoor Air Monitoring: Indoor low-cost sensors can be used for indoor activities. Do not compare uncorrected sensor data to the AQI. Compare sensor data in locations throughout the facility and indoors vs outdoors. See Appendix B.</td>
</tr>
<tr>
<td>Adult Staff &amp; Volunteers</td>
<td>Adult staff and volunteers can be impacted by air pollution, see WA Air Quality Guide for Particle Pollution. For policies on outdoor workers during wildfire smoke, see WA DOH’s Wildfire Smoke Workplace Safety &amp; Health webpage. School Closures: Consider school and facility closures if you cannot maintain indoor 1255 μg/m³ (AQL2 value of 2011). See Summary Wildfire Smoke Guidance for Closing Schools, which includes factors to consider.</td>
</tr>
</tbody>

Acknowledgements

Key adjustments to reflect changes to the Air Quality Index and other updates were made in 2024 led by Annie Doubleday (WA State Department of Health (DOH)) and Jill Schulte (WA State Department of Ecology (ECY)). Julie Fox, Kaitlyn Kelly, and Orly Stampfer of DOH made significant contributions to the 2022 updates. This document was first developed in collaboration with the Closures Workgroup of the Wildfire Smoke Impacts Advisory Group, led by Julie Fox, with air monitoring expertise from Jill Schulte. This is an interagency group of local, state, and federal partners, and academic partners, who are professionals in air quality and public health practice. The original Closures Workgroup members include the following*:

Len Adams; Community Engagement and Healthy Homes Program Manager, Tacoma-Pierce County Health Department

Ryan Allen, CDE; Industrial Hygiene Technical Policy and Lab Program Manager, Washington State Department of Labor and Industries

Nancy Beaudet, MS, CIH; Exposure Scientist, University of Washington Department of Environmental and Occupational Health Sciences, Pediatric Environmental Health Specialty Unit

Nancy Bernard, MPH, REHS; Program Manager School Environmental Health & Safety, Indoor Air Quality Specialist, Washington State Department of Health

Teresa Everson, MD, MPH; Health Officer of Yakima Health District, Deputy Health Officer of Clark and Skamania Counties

Julie R. Fox, PhD, MHS; Ambient Air Epidemiologist, Washington State Department of Health

Matt Kadlec, PhD; Toxicologist, Washington State Department of Ecology

Catherine Karr, MD, PhD, MS; Professor, University of Washington Department of Environmental and Occupational Health Sciences, Pediatric Environmental Health Specialty Unit

Mark Larson, MD, MPH; Health Officer, Kittitas County Public Health Department

Bob Lutz, MD; Health Officer, Spokane Regional Health District and Asotin County Health District

*These were the titles and positions of contributors at the time of first publication in 2019.
