WASHINGTON VITAL STATISTICS SUMMARY

1953

WASHINGTON STATE DEPARTMENT OF HEALTH

PUBLIC HEALTH STATISTICS SECTION

Olympia

Arthur B. Langlie
Governor

John A. Kahl, M.D., M.P.H.
Acting State Director of Health

November, 1953

The Honorable Arthur B. Langlie
Governor, The State of Washington
Olympia, Washington

Honorable Sir:

I have the pleasure of submitting the Vital Statistics Summary Report of the State Department of Health for the calendar year 1953.

The report presents vital statistics data in narrative, graphic and tabular form for use in public health, demographic and related fields.

Respectfully submitted,

John A. Kahl, M. D., M. P. H.
Acting State Director of Health

INTRODUCTION

Data on livebirths, deaths, and fetal deaths (stillbirths) are presented in this report for the calendar year 1953. In addition, 1953 estimated population figures are included. Data are reported for the state as a whole, each county and each city of 10,000 or more population.

Certain additional data, including data for cities of 2500 to 10,000 population are available in unpublished form in the files of the Public Health Statistics Section.

Vital statistics data included in this report are identified either as residence or occurrence data. Residence data refer to vital events involving residents of the area regardless of where the vital events actually occurred. Occurrence data refer to vital events actually occurring in the area regardless of the place of residence of the persons involved. In general, data on a residence basis are the most useful.

Data for 1953 vital events which did not occur in Washington to residents are as follows:

| | Livebirths | Fetal Deaths | Deaths |
|--|------------|--------------|--------|
| Vital events occurring in Washington to non- residents | 2,416 | 34 | 854 |
| Vital events occurring to Washington residents outside the State | 974 | | 625 |

It can be observed that 1953 vital events occurring in this state to out-of-state residents were higher than vital events occurring among Washington residents outside the state.

Appendix tables contain selected morbidity data, marriage and divorce data, and hospital and nursing home data for the calendar year 1953.

The above estimates of population for the major cities of Washington are based on the State Census Board release of population figures as of April 1, 1953 projected to July 1, 1953. The population estimates for the counties are independently derived by the Public Health Statistics Section of the State Department of Health.

* Unincorporated

NATALITY

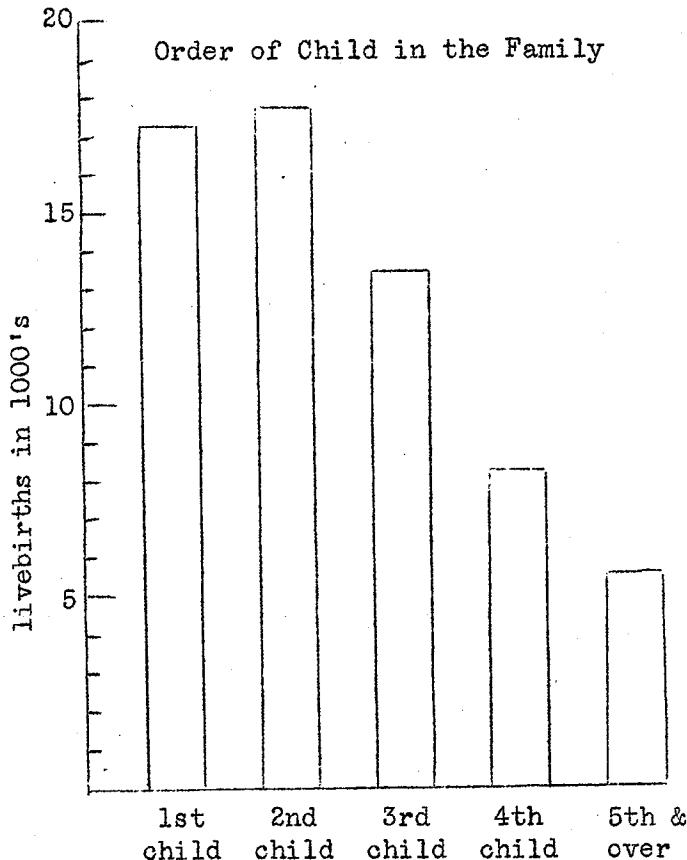

Livebirths

Washington livebirths in 1953 were numerically the largest this state has ever known, with 63,013 births occurring in the state and 61,571 births to Washington residents. The resident birth rate of 24.4 is slightly lower than the rate for 1952, but higher than 1950 and 1951. Table 1 gives births from 1910 through 1953, with rates per 1,000 population. These data are presented graphically on pages 3 and 4. It can be observed that in general the trend has been upward, although a downward trend prevailed in the 1920's and early 1930's, resulting in the low rate of 12.9 in 1933.

Counties showing the highest resident birth rates for 1953 (all those over 30.0) were Grant, 33.7; Island, 31.3; and Benton, 30.1. Counties showing the lowest rates (all those under 20.0) were San Juan, 15.8; Columbia, 18.6; and Wahkiakum, 18.5. Resident and occurrence births for 1953, with rates per 1,000 population are given in Table 4, page 12.

Of the total resident births, 95.9% were classified as white; 1.7% as Negro; 1.3% as Indian; and the balance Oriental or other. County data by race are given in Table 5, Page 14.

Of the births by residence, 99.2% were born in hospitals, maternity homes, or other institutions. Resident and occurrence data by place of birth are given in Table 7, page 18.

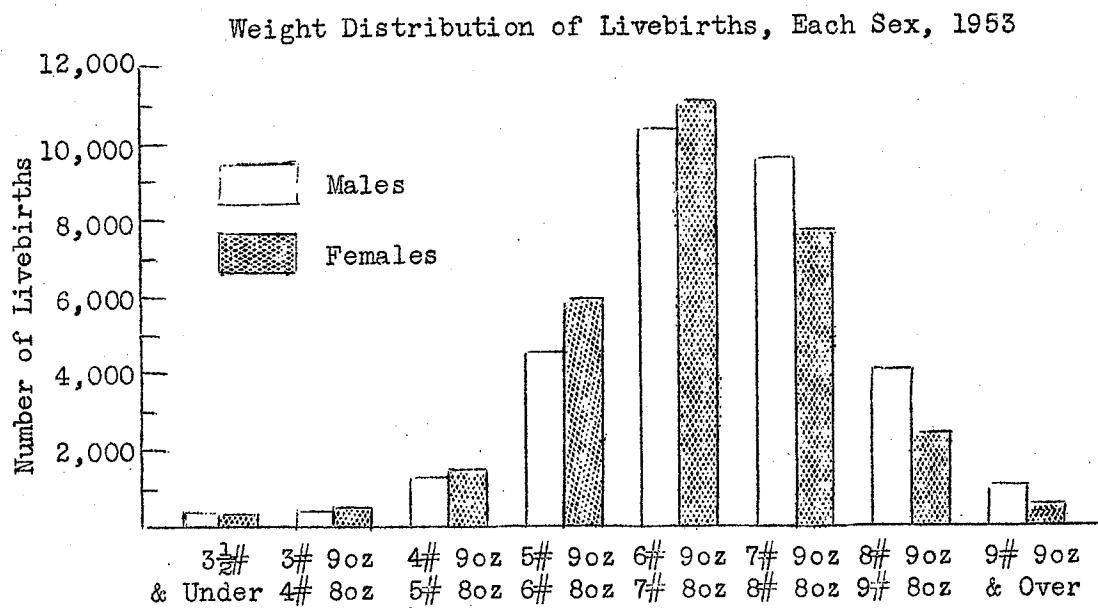

The sex ratio in residence livebirths was 105.1 males for every 100 females. More births were the second child of the family than the first, 28.7% of the total resident livebirths being the second child, while 28.0% were the first child, and 21.8% the third child. The order of child in the family is illustrated in the chart at the left, and is presented in tabulated form in the Birth Summary Table, page 10.

A total of 684 sets of twins were born in 1953, 661 full sets and 23 sets with one child a fetal death. In addition, 9 full sets of triplets were born. The county and city breakdown on multiple births is given in Table 9, page 22.

The median age of mothers in 1953 was 25 years, although the greatest percentage of births occurred in the 20 - 24 age group.

Resident illegitimate livebirths were 19.8 per 1000 resident livebirths, and occurrence illegitimate livebirths were 20.8 per 1000 occurrence livebirths. Table 9, page 22, contains data on illegitimate livebirths by county and city of residence and occurrence.

Male infants weighed more at birth than female infants; the average weight for males being 7# 4 oz. compared to 7# 1 oz. for the female births. The above graph shows weight distribution by sex. Defining immaturity as infants weighing $5\frac{1}{2}$ pounds or less at birth, there were 4,658 immature livebirths, or 7.4% of the total resident livebirths. Tables 9, 10 and 11, pages 22, 24 and 26, give data by county and city on immaturity.

Pages 10 through 29 contain data on livebirths for Washington for 1953.

Fetal Deaths (Stillbirths)

For each 1000 resident livebirths in 1953 there were an additional 13.5 fetal deaths, a total of 834 resident fetal deaths. In addition to the 63,013 livebirths occurring in Washington, 868 fetal deaths were also recorded, a ratio of 13.8 per 1000 livebirths. For purposes of Washington vital statistics registration, a fetal death is defined as a delivery, after at least twenty weeks gestation, in which the fetus shows no evidence of life.

Among the causes of fetal deaths, placental and cord conditions accounted for 44.6% of all resident fetal deaths. Table 15, page 32, gives further data on resident fetal deaths by causes. There were 115.7 male fetal deaths for each 100 female fetal deaths. Fetal deaths by county and city of residence and by county and city of occurrence, with ratio per 1000 livebirths, are given in Table 13, page 30.

MORTALITY

General

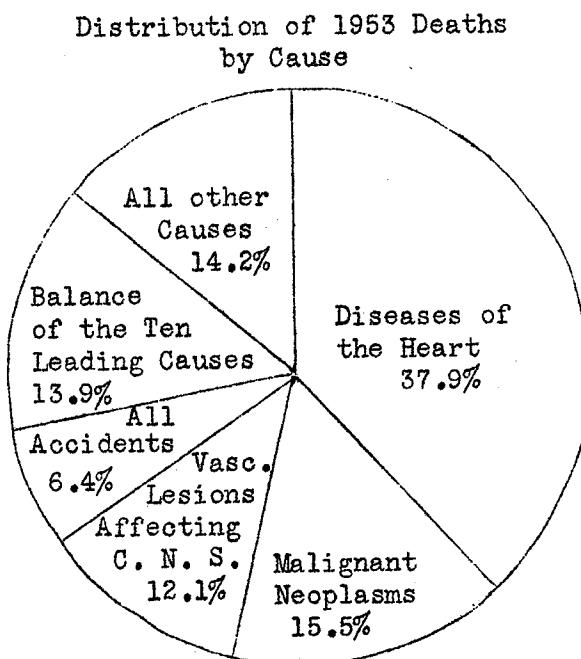

There were 23,279 deaths of residents of Washington in 1953, a rate of 9.2 per 1000 population. Deaths occurred in Washington at a rate of 9.3 per 1000 population for a total of 23,508. Garfield County had the highest resident death rate with 11.9 per 1000 population. The lowest death rates were shown by Grant and Benton Counties, each with a rate of 4.3 per 1000 population.

The sex ratio for resident deaths in 1953 was 154 male deaths for every 100 female deaths. Of the male deaths, 52.3% were married at the time of death, and 17.3% were widowers. Female deaths included 36.5% married and 45.9% widowed. The median age of males dying was 66.5; median age at death for females was 71.6. The white race accounted for 97.2% of the total deaths.

General mortality data are given in the death summary Table 16, page 36, and in Tables 17 through 32, which contain county and city data.

Selected Causes

Table 17, page 38, gives selected causes of death for all ages, arranged according to the causes of death codes as determined by the International Statistical Classification of Cause of Death. The death summary table also lists the thirteen leading causes of death according to rank. Tables 24, 25, 26 and 27, pages 53 through 60, give rates per 100,000 population.

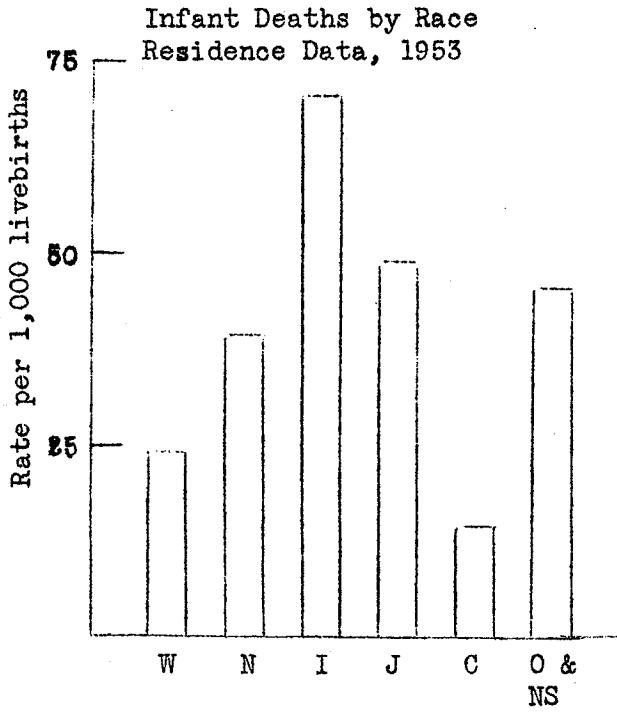

"Diseases of the Heart" accounted for 37.9% of the total deaths of Washington State residents in 1953, with a rate of 349.0 per 100,000 population. "Diseases of the Heart has been the leading cause of death in Washington since 1913 with the exception of pneumonia in 1918. Tuberculosis was the leading cause of death before that time but in 1952 and 1953 tuberculosis no longer ranked as one of the ten leading causes. "Malignant Neoplasms" and "Vascular Lesions Affecting the Central Nervous System" have been the second and third leading causes since the early 1920's.

The fourth leading cause, "All Accidents" was the leading cause of death in the age groups from 1 through 34. "Malignant Neoplasms" were the second leading cause in all age groups from 5 through 74. "Congenital Malformations" are the second leading cause of death at ages under 5. At ages of 75 and over, the second leading cause of death is "Vascular Lesions Affecting the Central Nervous System". Suicide was the third leading cause of death in the age groups from 15 through 34. Table 18, page 40, lists the leading causes of death in each five year age group for each sex, with the percentage each comprises of the total deaths in each age group.

Other causes of death, of interest though not leading causes, are given in Tables 27 and 28, pages 59 and 61. Deaths from motor vehicle accidents are included in the category "All Accidents", but are given by county and city of residence and by county and city of occurrence of deaths in Table 27, page 59. Homicides by county and city of residence and occurrence are given in Table 27, page 59. Deaths from infective and parasitic diseases, except tuberculosis, are given in Table 28, page 61. Tuberculosis deaths are given in Table 27, page 59.

There were 18 maternal deaths in 1953. Data on maternal deaths are given in Table 29, page 63.

Infant Deaths

Infants accounted for 6.7% of the total deaths in 1953. The infant death rate was 25.3 per 1000 livebirths by residence; a rise from the low of 24.3 in 1951, but still considerably below other years. As can be seen in the graph, page 4, infant mortality has experienced a steady decline since 1910.

Indians again showed the highest infant death rate, 70.7 per 1000 livebirths. Although higher than the 1952 rate of 65.5, this is much lower than the rates in 1950 and 1951. The graph at the left shows 1953 resident infant death rates by race. Table 30, page 64, gives infant deaths by county and city of residence and of occurrence, with rates per 1000 livebirths.

Of resident infant deaths in 1953, 157.2 males died for every 100 females. In 1952 this ratio was 150.6 males to every 100 females. This represents a male infant death rate for 1953 of 30.1 deaths per 1000 male livebirths, and a female infant death rate of 20.1 per 1000 female livebirths.

The greatest number of infant deaths occurred under the International List category 760 - 776, "Certain Diseases of Early Infancy", with 61.9% of the 1953 resident infant deaths in that category. Of this group immaturity mentioned with some other condition, and immaturity unqualified accounted for the greatest number of deaths, 45.1% of the total infant deaths. Congenital malformations accounted for 16.0% more of the deaths, followed by 9.1% dying from influenza and pneumonia (not including pneumonia of the newborn, which is included in the category "Certain Diseases of Early Infancy") and 4.2% dying from accidents.

Table 31, page 66, gives a detailed breakdown of infant deaths by cause, sex, and age of infant. Table 32, page 68, lists leading causes for the counties and major cities. Resident neonatal deaths, those under 28 days, accounted for 73.5% of the total resident infant deaths in 1953. Neonatal deaths by county and city of residence and by county and city of occurrence are given in Table 30, page 64.
