Introduction

The 1987 Summary of Vital Statistics and Induced Terminations of Pregnancy contains a summary presentation, in tabular form, of the vital events (birth, death, marriage, divorce) and induced abortions which occurred during the calendar year 1987. In the interest of easy comparison, essentially the same format of tabular presentation has been continued as was used in previous reports, except that several new tables have been added this year:

Natality

Table 14. Live Births with Maternal Smoking by Mother's Place of Residence, Washington State 1987.

Mortality

- Table 11. Deaths Due to Human Immunodeficiency Virus by Rates by Place of Residence, Washington State 1987.
- Table 17. Deaths Due to Human Immunodeficiency Virus by Rates by Place of Occurrence, Washington State 1987.

Induced Terminations Of Pregnancy

- Table 16. Second TrimesterA bortions by Patient's Age by County of Residence, Washington State 1987.
- Table 17. Repeat Abortions by Patient's Age by County of Residence, Washington State 1987.

Two additional changes have been made:

- 1. On Birth Table 1D (Residence Live Births by Attendant), the category previously grouped as 'midwife' has been separated into three entries: licensed, certified, and other midwife.
- 2. Death Table 21 (Infant Deaths by Race by Place of Residence) is now tabulated by child's race at birth rather than race at death, as was used in previous years. This change was made in recognition of the fact that the race at death underestimates infant mortality among minority groups, as some infants classified non-White at birth are classified White at death.

For those who find that the data in this report do not meet all their needs, additional data are available and can be obtained by calling Statistics at (206) 753-5938.

Natality Mortality Infant Mortality Fetal Mortality

Introduction

The birth, death, infant and fetal death analysis section has two parts for each data source. The first part ("1987 At A Glance") puts 1987 vital events into perspective by comparing them to US data and presenting time trends for Washington State. The second part ("Is Washington State Meeting 1990 Goals?") examines whether or not Washington State will meet the Surgeon General's 1990 goals. These goals have been established as targets to guide health promotion and disease prevention programs in their efforts to improve the health of the American people by the year 1990. Tracking progress towards these goals helps to identify areas where the state is doing comparatively well and problem areas where special efforts may be needed.

Methods

<u>Trends</u> are determined by comparing 1987 to the previous five years, thus they represent recent trends only. Long-term trends in rates are shown on the accompanying graphs.

<u>Projected 1990</u> Washington State rates are determined by assuming that current trends will continue to 1990. Because this is a rough approximation, projected data are given in whole numbers only, to reflect their uncertainty.

Sources Of Data

Washington State data are based on 1987 Washington State resident events, except where two or three years are combined to provide more stability in rates. These cases are noted on the tables.

<u>US figures</u> are based on data reported in the National Center for Health Statistics (NCHS) Monthly Vital Statistics Reports (USDHHS, Public Health Service, Hyattsville, Maryland). Data are the most recently available; data years used are noted on the tables.

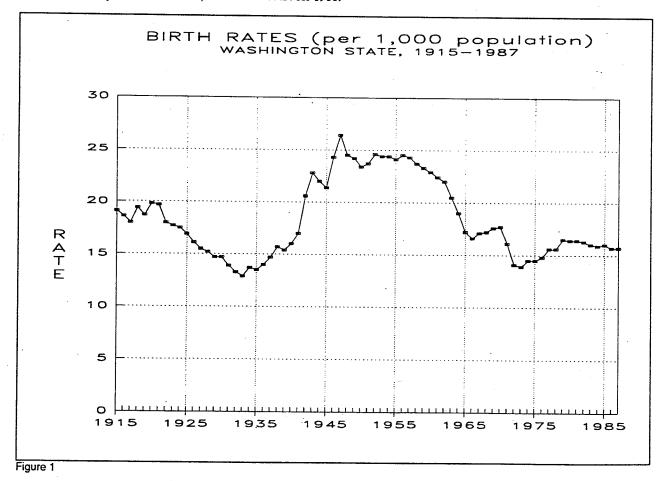

1990 goals are given in the NCHS publication Health: United States, 1986. (DHHS Publication No. PHS 87-1232. Public Health Service, Washington, US Government Printing Office, December, 1986).

1987 Natality at a Glance

Washington State 1987

Item	Data	Trend ¹	Comparable US Data ²
Number of Births	70,329	N	
Birth Rate (per 1,000 population)	15.7	-	15.7
Fertility Rate (per 1,000 women aged 15-44	66.1	-	66.1
Low Birth Weight Births (2,500 grams or less)	5.4%	+	6.8%
Births to Unwed Mothers	20.8%	+	22.0%
Plural Births	2.2%	+	2.1%
First Child	40.9%	N	41.3%
Deliveries by Unlicensed Attendant	0.5%	•	0.6%
Births at Home	1.6%	N	1.0%

 $^{^{1}}_{2}$ - = decreasing, + = increasing, N = no change. Birth and fertility rates are for 1987; other US Data are for 1986.

Is Washington State Meeting 1990 Goals?

1990 Goals, Washington State and US Compared

-	Washing	Washington State United State				
	Current ¹	Projected 1990	Current ²	1990 Goal		
Family Planning						
Teen Birth Rate (per 1,000 girls in each age group)			٠			
15 year olds	9.7	10	13.7	10		
16 year olds	22.4	22	29.7	25		
17 year olds	42.7	44	50.6	45		
Infant and Maternal Health						
Percent Low Birth Weight (2,500 grams or less)						
All Births	5.4	5	6.8	5		
White	4.9	5	5.6	9		
Black	10.2	11	12.5	9		
American Indian	6.5	7	6.1	9		
Other	6.8	6	6.4	9		
Maternal Mortality Rate (per 100,000 births)		1				
All Births	6.7	5	7.2	5		
White	5.5	5	4.9	5		
Black	19.9	10	18.8	5		
Improved Services						
Percent Beginning Prenatal Care after 1st Trimester	,					
All Births	22.8	24	24.1	10		
White	20.6	22	20.8	10		
Black	36.5	36	38.4	10		
American Indian	37.4	38	40.0	10		

¹ Birth weight and prenatal care data are for 1987; other data are for 1985-1986.

Teen data are for 1985; other US data are for 1986.

Areas of Concern

- Increase in birth rates for 15 year-olds (although goals will probably be met).
- Possible increase in proportion of low birth weight infants (although goals will still be met for all but Blacks).
- High maternal mortality rates for Blacks.
- High levels of late care, especially for Non-Whites.

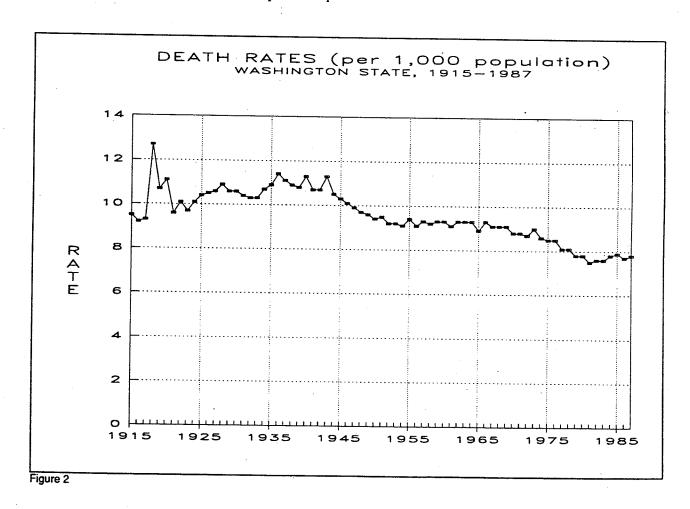

1987 Mortality at a Glance

Washington State 1987

Item	Data	Trend ²	Comparable US Data ³
Number of Deaths	34,967	+	
Death Rate (deaths per 1,000 population)	7.8	+	8.7

25-64	341.9	320	423.2	400.0
Injury Prevention				
Motor Vehicle Accidents	18.8	17	20.1	18.0
Children under 15	7.4	7	7.0	5.5
Home Accidents				0.0
Children under 15	5.4	5 -	4.8	5.0
Falls	5.6	5	5.0	2.0
Drowning	2.6	2	1.8	1.5
Stress and Violent Behavior			·	
Suicide: Ages 15-24	17.6	17	12.8	11.0
Male	27.7	28	19.9	11.0
Female	6.8	5	5.1	11.0
Alcohol Abuse				
Cirrhosis of the Liver	9.2	9	10.7	12.0
White	9.3	9	10.7	12.0
Black	11.8	12	12.8	12.0
American Indian	19.1	17	Not Available	12.0

 $^{^{\}rm I}$ Rates based on deaths/100,000 population in group.

Areas of Concern

- High motor vehicle accident death rates for children under 15.
- High death rates from falls and drowning for the general population.
- High suicide rates for the 15-24 age group, especially for males.
- High (though decreasing) Indian cirrhosis death rates; possibly increasing Black cirrhosis death rates.

² Data Years: Ages 1-24, home and motor vehicle accidents, suicides (1986-87); all others (1987).

Data Years: Home accidents, falls, drowning, sex-specific suicide rates (1985); race-specific cirrhosis rates (1986); ages 15-24, total suicides (1986-87); all others (1987).

1987 Infant Mortality at a Glance

Washington State 1987

ltem	Data	Trend ²	Comparable US Data ³
Number of Infant Deaths	681	N	
Infant Death Rate (deaths per 1,000 live births)	•		
All Infant Deaths	9.7	N	10.0
Neonatal (0-27 days)	5.2	N	6.4
Postneonatal (28 days - 1 year)	4.5	N	3.5

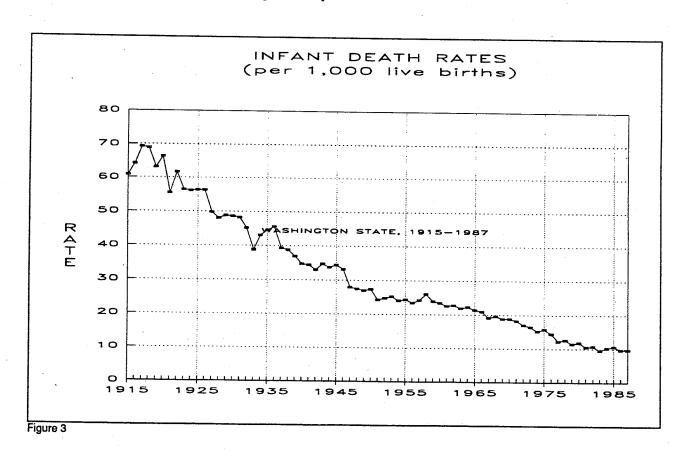

Leading Cause¹ Death Rates (deaths per 100,000 population)

Certain Causes of Mortality in Early Infancy	232.1	N	362.7
Sudden Infant Death Syndrome (SIDS)	259.2	N	116.1
Congenital Anomalies	217.9	N	207.0
Birth Injury and Anoxia	133.9	N	116.9

¹ Mortality Table 12 gives International List Numbers (ICD-9 codes) for these causes.

² -= decreasing, += increasing, N = no change.

³ Rates by cause are provisional, based on a ten percent sample.

Is Washington State Meeting 1990 Goals?

1990 Goals, Washington State and US Infant Death Rates Compared

	Washing	ton State	United States	
	Current ¹	Projected 1990	Current ²	1990 Goal
All Infant Deaths	9.7	10	10.0	9.0
Neonatal Deaths Postneonatal Deaths	5.2 4.5	5 5	6.5 3.4	6.5
Racial Groups		3	3.4	2.5
White Black	9.6	10	8.9	12.0
American Indian	14.5 11.5	14 10	18.0 9.5	12.0 12.0

Race-specific mortality rates are for 1986-87; other data are for 1987.

Areas of Concern

- High postneonatal death rates. This is a major concern. Washington State has the sixth highest postneonatal mortality rate in the nation. Much of the postneonatal mortality is due to Sudden Infant Death Syndrome (SIDS). Washington State's SIDS death rates are considerably higher than US rates (see previous page).
- High Black infant mortality rates.

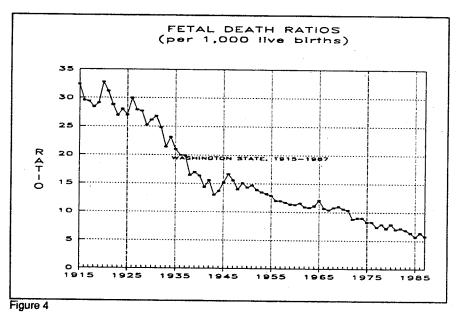

² White and Black mortality rates are for 1986; Indian rates are for 1985; other US figures are for 1987.

1987 Fetal Mortality at a Glance

Washington State 1987

Item	Data	Trend ¹	Comparable US Data ²
Number of Fetal Deaths	411	-	
Fetal Death Ratio (deaths per 1,000 live births)	5.8		7.3

^{- =} decreasing, + = increasing, N = nochange.

Is Washington State Meeting 1990 Goals?

1990 Goals, Washington State and US Fetal Death Rates Compared

	Washing	on State	United	States
	Current	Projected 1990	Current	1990 Goal
Perinatal Death Rate ¹ (deaths per 1,000 live birth)	8.4	8	10.8	5.5

Perinatal deaths include late fetal deaths (28+ weeks) plus early neonatal deaths (less than 7 days). Rates published elsewhere in this report include feal deaths of 20+ weeks gestation.

Areas of Concern

Perinatal mortality rates above the goal. The goal appears to be lower than the neonatal goal alone and may thus be unrealistic.

Induced Terminations of Pregnancy

Introduction

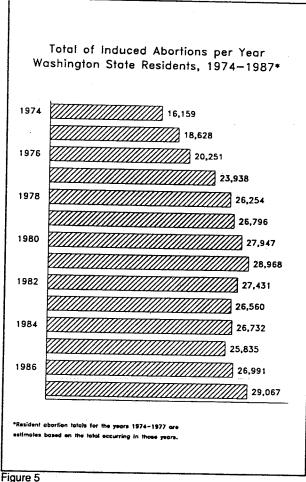

Abortion surveillance has been conducted by State public health officials since December, 1970. Induced abortion had become a legally allowable procedure in Washington State the previous month, when the then existing criminal abortion statute was overturned by referendum. The new law, which had some restrictions, was later superceded by United States Supreme Court decision in Roe v. Wade (1973).

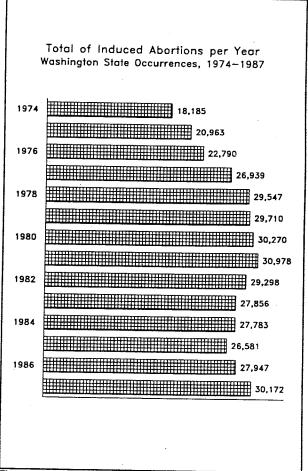

Initially, the purpose of the abortion reporting system was to evaluate the safety and adequacy of procedures. The data are also important for assessment in two other areas of public health concern: 1) prevention of unwanted pregnancies and 2) access to abortion services. Trends pertinent to each of these issues are illustrated in graphs and by map on this and the following pages. In addition, both state and county data are arrayed in the Induced Terminations of Pregnancy chapter of the tables section.

All the usual problems of data collection—underreporting, incompleteness, and inaccuracy—impose qualifications on any conclusions. See the Technical Notes, Appendices A and B, in this report for more detail on reporting problems and definitional issues.

Overview

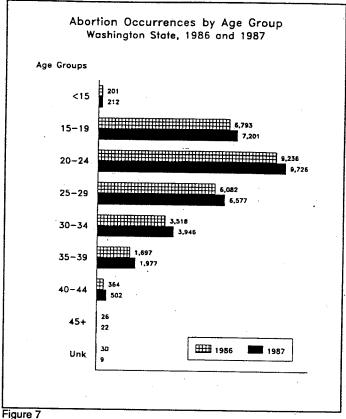

The totals for both Washington State resident abortions and abortion occurrences increased in 1987—from 26,991 to 29,067 (7.7%) and from 27,947 to 30,172 (8.0%), respectively.

Although change took place across nearly all age groups, there were both absolute and proportionate differences in age groups among both residents and occurrences.

The greatest proportional change within any one age group for induced terminations occurring in the State was in those aged 40-44 (+38%). The greatest differences in raw figures were for 25-29 year-olds (+495) and 20-24 year olds (+490).

Among residents, the greatest percentage gain was again among those 40-44 years old (+26%) and the greatest absolute difference was in the 20-24 age group (+505).

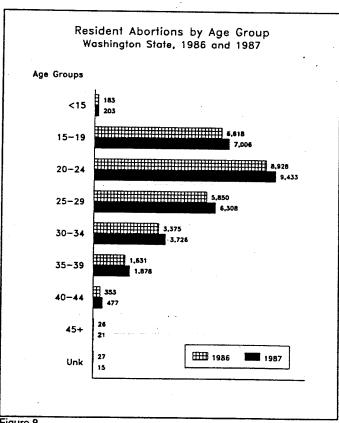

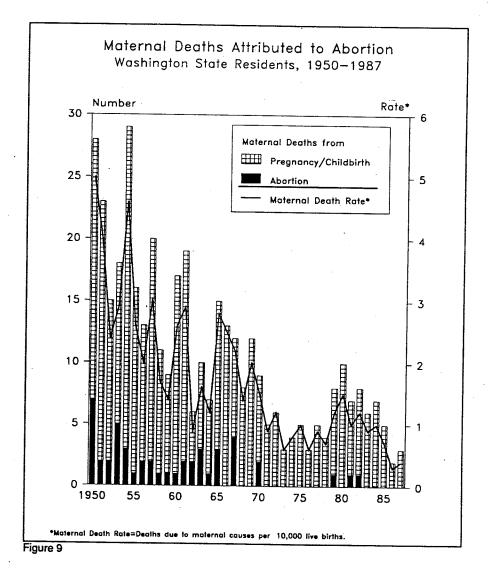

Figure 8

Mortality

Trends in abortion related mortality show that abortion has been nearly eliminated as a contributing factor in maternal deaths. Maternal deaths are deaths to women which are a result of complications of pregnancy or occur within six weeks of either live birth or abortive outcome. The maternal death rate is equal to the number of these deaths per 10,000 live births.

The data illustrated in the chart above do not differentiate between legal and illegal abortions. The two deaths in 1970 took place prior to the passage of the referendum in that year. The three deaths which occurred in the years following 1970 were the result of complications—one each, from: a legally induced abortion procedure (performed as a consequence of IUFD, intrauterine fetal demise) in 1979, a self-induced abortion in 1981, and a spontaneous abortion in 1982.

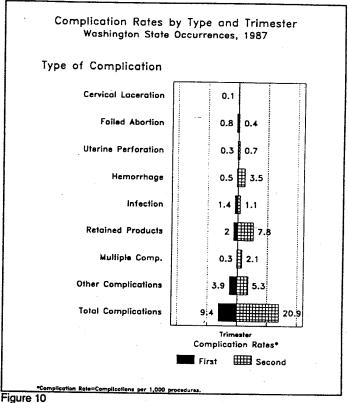

Nationally, the death-to-case rate, that is the number of deaths per 100,000 legally induced abortions, was 0.8 in 1983, 0.8 in 1984, and provisionally 0.5 in 1985.

¹United States Department of Health and Human Services, Centers for Disease Control, Center for Chronic Disease, Prevention, and Health Promotion, Division of Reproductive Health, <u>Abortion Statistics, U.S. 1984-1985 (Prerelease to State Health Agencies, 1989)</u>. Atlanta, GA: 1989.

Morbidity

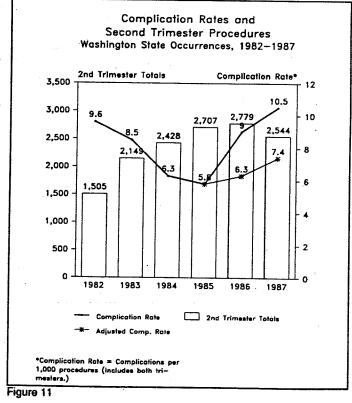

Typically, second trimester abortions have a higher complication rate than first trimester terminations. It should be noted that the division between first and second trimester is somewhat arbitrary at twelve weeks and complications are not always completely reported for either semester. (See Technical Notes, Appendix B, in this report.)

Retained products was the most frequently reported complication in either trimester in 1987. Some complications, e.g. infection, may be artificially low due to the completion of reporting forms before the complication is known.

In December, 1982 the abortion law was liberalized to allow second trimester procedures in approved nonhospital facilities. This factor and improved reporting may account for some of the rise in second trimester abortions that has occurred since 1983. In 1987, the number of second trimester procedures declined for the first time since 1982.

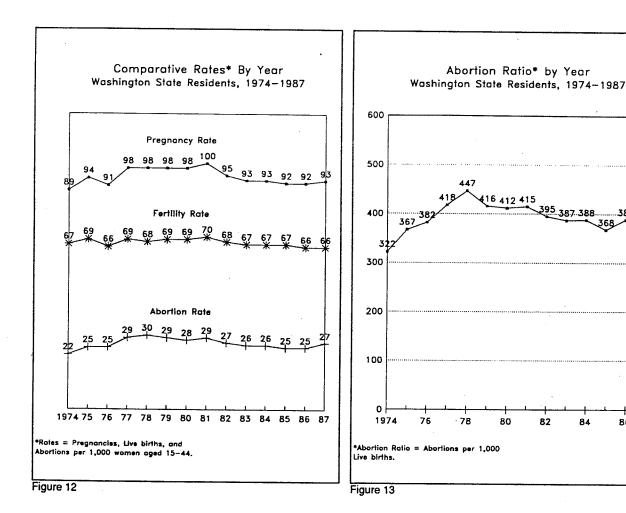

The 1987 complication rates in Figure 11 include 95 cases of minor complications reported under "other complications." Reports of "unexplained pain" and "hemorrhage less than 500cc." form 75% of the "other complications" category. Prior to 1986, such complications were suppressed before publication. This accounts for most of the increase in the complication rate.

86

Rates and Ratios

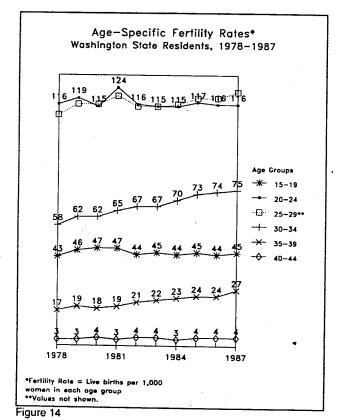

Pregnancy, abortion, and fertility rates and the abortion ratio are statistical indicators frequently used to assess need and efficacy of programs for the prevention of unwanted pregnancy. In 1987, the abortion rate (abortions per 1,000 women aged 15-44) for Washington State residents rose for the first time in six years to 27, up two points over the 1986 rate. A look at pregnancy, fertility, and abortion rates over the past eleven years, however, shows that all the rates are lower in the most recent six (1982-1987) than they were in the earlier five (1977-1981). A similar pattern is shown by the abortion ratio.

Abortion rates can be affected by either or both a change in the number of women getting pregnant (expressed mathematically by the pregnancy rate) or by the number of pregnant women choosing abortion (expressed indirectly by abortion ratios). In 1987, an increase in the abortion ratio of 6.2% was enough when coupled with a one point rise in the pregnancy rate to have an appreciable affect on the abortion rate. There was no change in the state's fertility rate over the previous year.

The three age-specific charts on the following page show age group differences in abortion ratios and abortion and fertility rates. Since 1978, the greatest change within individual age groups has been in fertility rates among 35-39 year-olds and 30-34 year-olds (+37% and +29%, respectively). In the same ten

years, the 15-19 year-olds were the only age group to show a decline in either rate, exhibiting a 12% decrease in their abortion rate.

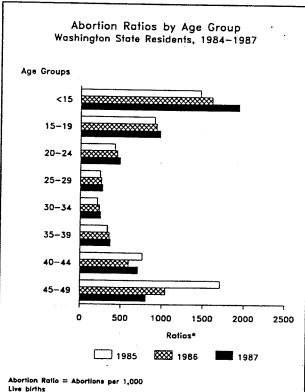

Figure 16

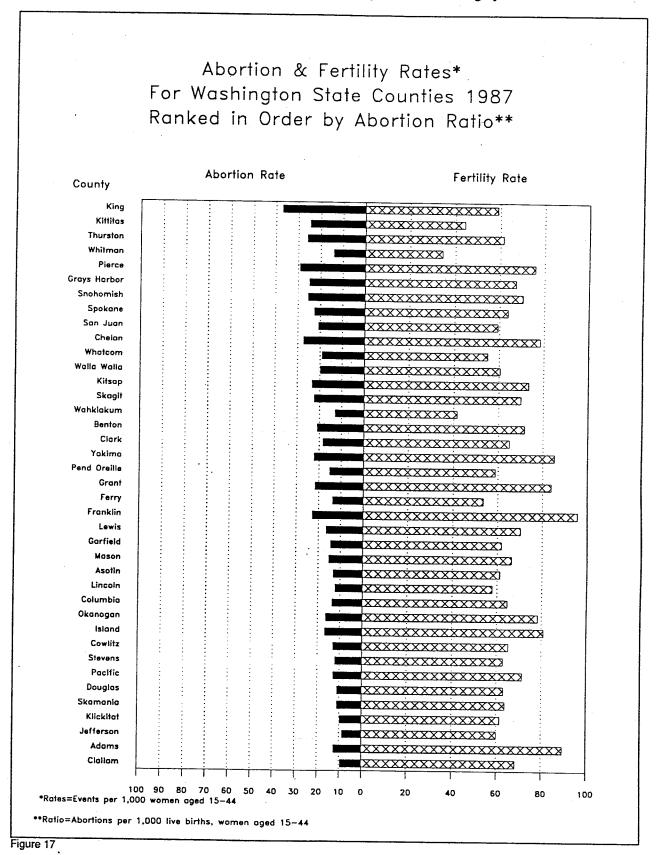

Figure 15

An examination of abortion ratios over the past three years by age groups reveals increases in all but the oldest age groups (40-44 years of age and 45 and older).*

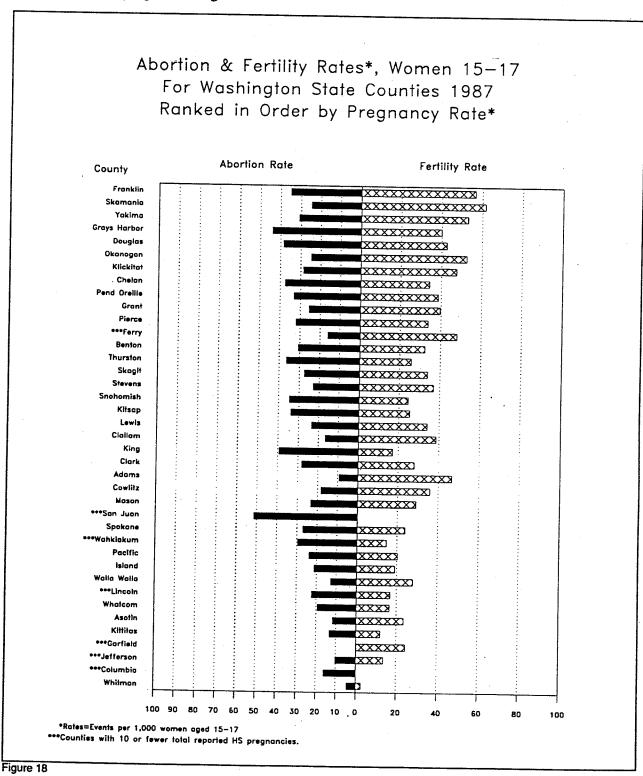

The figures on the next two pages illustrate the abortion and fertility rates by county for women aged 15-44 (Figure 17) and 15-17 (Figure 18). In addition, each chart shows the counties ranked by a third variable—abortion ratio and pregnancy rate, respectively. These variables were chosen for ranking based on their ability to reveal a discernable pattern in each chart and the pertinence to prevention of unwanted pregnancies each variable has for each age group. (The highest levels for these variables are at the top of each chart.)

*It should be understood that abortion ratios are more mercurial than rates because they are based on smaller divisors—small differences in total events can make large differences in the ratios from year to year. Furthermore, differences can be compounded. If total pregnancies remain the same, an increase in live births automatically creates a decrease in abortions or vice versa; thereby, doubling the effect on an abortion ratio.

The figure below shows county abortion and fertility rates and ranking by abortion ratio.

The chart on this page illustrates fertility and abortion rates for 15-17 year-olds in the 39 counties and ranks them by pregnancy rate for this age group. Some counties have very small populations of high-school-age women. For these counties, a small number of pregnancies in this age group often formulates a comparatively high rate. In these instances, data for several years should be examined. Seven counties (Columbia, Ferry, Garfield, Jefferson, Lincoln, San Juan, and Wahkiakum) had a total of ten or fewer pregnancies among high school age women.

Repeat Abortion

Repeat abortion is the commonly used term for cases with a patient history of one or more previous induced termination. Besides failure to take precautions to prevent pregnancy, there are a myriad of possible reasons, for a history of a repeat abortion (or for obtaining any abortion, for that matter), e.g., contraceptive

failure, fetal or maternal health problems, changes in economic, social, or psychological circumstances, incest, and/or rape. Adding to the complexity, many patients with a history of previous termination also show a history of one or more previous live births. No data is collected by the Washington State Abortion Reporting System on patients' use of contraceptives or reasons for choosing abortion.

Pregnancy history has been collected by the Abortion Reporting Form since 1981. Comparisons by age group should reflect an awareness of two countervailing factors at work in age-specific data on repeat abortion: 1)Older women are more at risk for repeat abortion because chances of a previous abortion is a function of age, and 2) Younger women are more at risk for repeat abortion because abortion has been legal for a longer proportion of their lives.

Figure 19 portrays the percentage of previous induced terminations by age. Unknowns were not tabulated. They approximate six to nine percent each year in each age group.

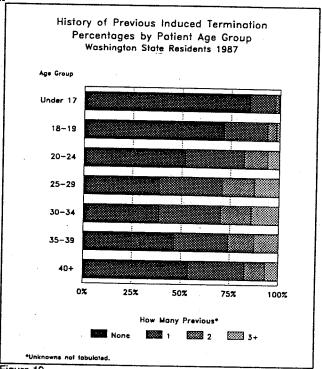

Figure 19

Figure 20 shows the trends in repeat abortion rates for women aged 15-19 and 20-24 and the percentage of previous live births in patient histories of previous abortion for these same age groups. The trendline for the repeat abortion rate (repeat abortions per 1,000 procedures) for the younger age group has remained nearly flat. (Slope = -0.82; Corr = -0.25). For 20-24 year-olds, it shows a slight by moderately steady increase over the seven years. (Slope = +7.35; Corr = +0.82). Both age groups contain a fairly consistent proportion of patients with a history of both a previous abortion and a previous live birth.

This year repeat abortions by patient's age by county of residence are arrayed in the tables section of this report.

²See Aida Torres and Jacqueline Darroch Forrest. "Why Do Women Have Abortions?" <u>Family Planning Persepectives</u>, July/August 1988.

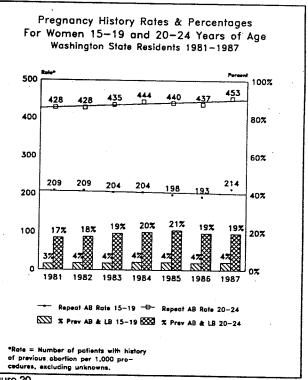

Figure 20

Access to Care

In the past six years, there has been a reduction in abortion service providers. From 1982 to 1987 the total number of facilities declined 15. Three were among those reporting fewer than 10 procedures; seven, between 10 and 49; and five, 50 or more. Since there has not been a corresponding drop in the number of abortions provided, the effect of this decline has been an increased concentration of patient load among fewer providers.

The map below depicts abortion services for counties with populations of 10,000 or more women between the ages of 15 and 44. Seven of these larger counties (Benton, Chelan, Cowlitz, Grays Harbor, Kitsap, Lewis, and Walla Walla) have no providers within their boundaries although all are adjacent to counties which do.

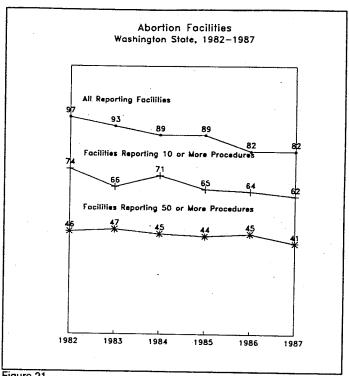

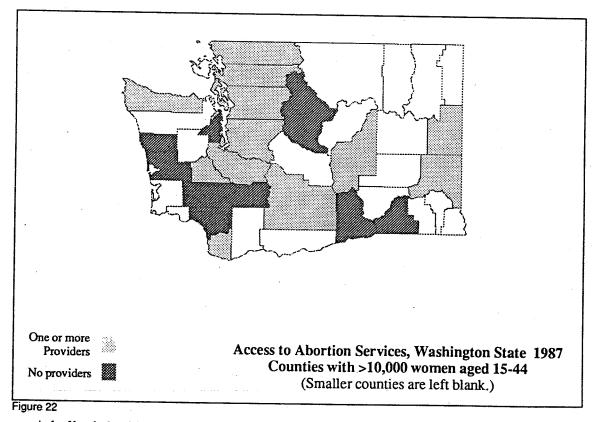

Figure 21

A decline in health care providers is always a public health concern because of the increased potential for adverse effects on patient health. Thus, in addition, to the ongoing concern regarding safety of procedure, attention must remain focused on maintaining access to care, as well as, prevention of the conditions which necessitate that care—in this case, that is—unwanted pregnancy.

¹Resident Abortion figures for 1974 through 1977 are estimates derived from occurrence abortion counts for those years. The occurrence counts were discounted 11.4 percent on the basis of the 1978 ratio of residents to occurrences (i.e., 88.86 percent of the total abortions reported in 1978 were to Washington State residents). Note that these estimates are not the same as those published in the 1978 and 1979 reports.

²Number of resident abortions per 1,000 resident live births.

APPENDIX

Appendix A

Definitions

Abortion - The termination (spontaneous or induced) of a pregnancy before the fetus has attained viability. Where unqualified in this report, the term refers to induced abortions.

Abortion-related Complications - Complications encountered and detected at the time pregnancy termination occurs and before the abortion report is filed.

Cervical laceration - a tear wound of the cervix which requires sutures.

Failed abortion - the products of conception fail to be expelled from the uterus after induction.

Hemorrhage - copious or excessive bleeding, clinically assessed.

Infection - inflammation of the endometrium (the mucous coat of the uterus) or elevation of body temperature over 100.4 degrees for one or more days.

Retained products - retention of some of the fetal or placental tissue in the uterus after an abortion procedure. A second procedure is required for removal.

Uterine perforation - unintentional puncture of the uterine wall which requires intervention.

Birth Weight - Weight of fetus or infant at time of delivery (normally recorded in pounds and ounces).

Fetal Death - Death prior to the complete expulsion or extraction from its mother of a product of human conception, irrespective of the duration of pregnancy. The death is indicated by the fact that after such expulsion or extraction the fetus does not breathe or show any other evidence of life such as beating of the heart, pulsation of the umbilical cord, or definite movement of voluntary muscles. Reporting of fetal deaths to the state is required only when the gestational period is twenty weeks or more.

Gestational Period - Number of weeks elapsed between the first day of the last menstrual period and date of delivery or date of pregnancy termination. The Abortion Reporting System relies upon the physician's estimate of gestational age. With current technology (i.e., ultrasound) accuracy is plus or minus 11 days.

Induced Abortion - The purposeful interruption of pregnancy, irrespective of the duration of pregnancy, with the intention other than to produce a live born infant or to remove a dead fetus, the result of which is not a live birth. Procedures for false pregnancy, ectopic pregnancy and missed abortion (dead ovum retained in uterus in intended pregnancy) are not included.

Induced Abortion Procedures:

Dilatation and Evacuation (D&E) - dilatation of the cervical canal by means of laminaria tents (sterile dried seaweed) until the cervical opening is large enough to allow removal of the uterine contents by means of a sponge forceps or some other specially designed instrument.

Hysterectomy - removal of the uterus by surgical procedure either with the fetus inside or after the fetus is removed; usually performed when a pathological condition of the uterus, such as fibroid tumors, warrants its removal, or when a woman desires sterilization.

Hysterotomy - surgical entry into the uterus, as in a Caesarean section, to remove a fetus too immature to survive, even with extraordinary life support measures; usually performed only if other abortion measures have failed.

Prostaglandin - induction of labor resulting in the expulsion of the fetus by administration of a substance with hormone-like action, either vaginal suppository or intra-amniotic injection.

Saline - induction of labor with eventual expulsion of the fetus by insertion of a hollow needle through the abdominal wall, withdrawal of a portion of the amniotic fluid from the uterine cavity, and subsequent replacement with a concentrated salt solution.

Sharp Curettage - dilatation of the cervical canal with scraping and removal of fetal and placental tissues by use of a curette (which resembles a small spoon). Also, surgical D&C or surgical curettage.

Suction Curettage - dilatation of the cervical canal by the successive insertion of instruments of increasing diameter called dilators until the opening is large enough to insert a flexible tube (cannula) into the uterine cavity and permit the suction removal of fetal and placental tissues by an electric vacuum pump. Also, vacuum aspiration, suction D&C, or early uterine evacuation.

Infant Death - Death of a child under one year of age.

Live Birth - The complete expulsion or extraction from its mother of a product of human conception, irrespective of the duration of pregnancy, which, after such expulsion or extraction, breathes, or shows any other evidence of life such as beating of the heart, pulsation of the umbilical cord, or definite movement of voluntary muscles, whether or not the umbilical cord has been cut or the placenta is attached.

Live Birth Order - Total number of live births to a given mother, including current birth.

Maternal Death - Death attributed to complications of pregnancy, childbirth, or the puerperium; includes abortion related death.

Neonatal Death - Death of an infant within the first 27 days of life.

Nulliparous - Having never given birth to a liveborn infant.

Occurrence Data - Data allocated by place where event occurred, regardless of the person's place of residence.

Parity - Previous live births; does not include current birth.

Perinatal Death - Fetal deaths plus deaths to infants within the first six days of life.

Premature Birth - A live birth weighing 2,500 grams (5-1/2 pounds) or less. If birth weight is not stated, length of gestation (under 37 weeks) is used.

Residence Data - Data allocated by place of residence of the decedent (deaths), or by place of residence of the child's mother (births, fetal deaths) or patient (abortions).

Spontaneous Abortion - An unintended interruption of pregnancy the result of which is a fetal death of any gestational age. Also, miscarriage or miscarried pregnancy.

Trimester- The duration of human pregnancy, approximately 266 days, divided by 3, resulting in three equal time periods equaling 88.67 days, or 12.67 weeks, or approximately three months, each. As a useful rule-of-thumb, gestation weeks 1 through 12 are considered the first trimester of pregnancy; weeks 13 through 24, the second trimester, and over 24 weeks, the third trimester.

Rates and Ratios

Rates and ratios are calculated by dividing the event of concern by the population at risk or a related population and multiplying by a constant (i.e. 1,000, 10,000, or 100,000). See below.

Abortion Rate - Number of abortions per 1,000 female population aged 15 to 44.

Abortion Ratio - Number of abortions per 1,000 live births.

Age-specific Rate - Number in event of concern for a specific age group per some fixed constant of population in that age group. For instance, the age-specific death rate is the number of deaths in a specific age group per 100,000 population in that age group. See different rates, i.e. fertility, pregnancy, abortion, for most typically used fixed constant in each rate.

Cause-specific Death Rate - Number of deaths from a specific cause per 100,000 population.

Complication Rate - Number of complication cases per 1,000 procedures; one case may have more than one complication.

(crude) Birth Rate - Number of live births per 1,000 population.

(crude) Death Rate - Number of deaths per 1,000 population.

Fertility Rate - Number of live births per 1,000 women, 15-44 years of age.

Fetal Death Ratio - Number of fetal deaths per 1,000 live births.

Infant Death Rate - Number of infant deaths per 1,000 live births.

Maternal Death Rate - Number of maternal deaths per 10,000 live births.

Neonatal Death Rate - Number of neonatal deaths per 1,000 live births.

Perinatal Death Rate - Number of perinatal deaths per 1,000 live births plus fetal deaths.

Pregnancy Rate - Number of total pregnancies (live births, fetal deaths, and abortions) per 1,000 female population aged 15-44.

Appendix B

Technical Notes

Reliability Of The Data

In analyzing any data, the possibility of errors in the data must not be overlooked. There are several types of possible errors, including underreporting or under-registration, errors made by the informant, and errors in compilation and processing. The most potentially dangerous error, however, is probably that of improper interpretation.

Statistics are neither more true nor false than the interpretation given to them. It should be emphasized that most of the rates computed in this report are crude rates. For comparing geographic areas, crude rates are limited. They do not reflect differences in age, sex, race, and other population characteristics. In addition, it is important to recognize the possible distortion in these rates where the number of events or the population is small. Minor variations in the number of events may result in major changes in the rates. Special caution should also be exercised in analyzing trend data, because of changes throughout the years in medical diagnosis, coding definitions, and registration coverage.

Collection Year

Data for the Vital Statistics and Induced Terminations of Pregnancy report are compiled from items on birth, death, marriage, and divorce certificates, and abortion reports received before April 15, 1988. (See Appendix F for samples.)

Interstate Exchanges

Washington State is a member of the interstate exchange agreement and receives birth and death certificates of residents who have died in other states. Although, no formal agreement exists, some states have agreed to exchange abortion reports. Out-of-state marriage and divorce certificates are not exchanged.

Population

Population data in this report are an estimate of population provided by the Washington State Office of Financial Management, April 1, 1987.

Race

The race of women obtaining induced abortions, although collected, is not useful for analysis because of the large number of reported unknowns and blanks. In 1987, "unknown" was the second largest category, amounting to more than all other racial categories combined except white among reported abortions.

The determination of race on birth and death certificates follows decision rules established by the National Center for Health Statistics (NCHS).

If more than one race is listed and one is Hawaiian, Hawaiian is selected. In cases of other races, the first non-white race listed is selected.

To determine race of newborns on birth certificates, each parent's race is first established according to the previous rules. Rules to determine race of the child, then, fall along a similar pattern:

- If either parent is Hawaiian, then the child's race is considered Hawaiian.
- In cases where one parent is white and the other non-white, the non-white race is selected as the race of the child.

• If both parents are non-white, the father's race is selected except where the mother's race is Hawaiian.

The racial category, Mexican/Chicano, is exclusive to persons who identified themselves as either Mexican, Chicano, or Mexican-American. Persons who identified themselves as Hispanic or as one of several other ethnic groups of Spanish origin, such as Cuban or Puerto Rican, were not included in this category. Using the category Mexican/Chicano as a surrogate for Spanish origin or Hispanic could result in erroneous conclusions.

Occurrence Data

The validity of occurrence death data has some limitations. As the death certificate does not specify inside or outside of corporate limits for place of death, rural deaths may be incorrectly assigned to cities because the location of death was in close proximity to a city. Informants, moreover, often are unaware of city boundaries.

Cause Of Death Classification

The causes of death presented herein are classified in accordance with the The International Classification of Diseases, Ninth Revision published by the World Health Organization. The State of Washington began using this revision January 1, 1979.

Ranking Of Leading Causes Of Death

In the interest of comparability, this summary uses, in general, the cause of death groups established by the National Center for Health Statistics (NCHS).

Low Birth Weight

Traditionally, low birth weight has been defined as 2,500 grams or less. However, the International Classification of Diseases, Ninth Revision (ICD-9) redefines low birth weight as less than 2,500 grams. Thus, 2,500 grams should now be included with the normal birth weight category. The impact of this change is minimal in the United States, where most weights are given in pounds and ounces. No weight of pounds and ounces converts exactly to 2,500 grams (5lb, 8oz is 2,495g and 5lb 9oz is 2,523g). It is, therefore, unlikely that many weights of 2,500 grams are recorded. In fact, none were found in a study of 1984 Washington State births. In the interests of consistency with past data, Washington State has chosen to continue including 2,500 grams with the low birth weight category.

Abortion Complications

Complication totals and rates of abortion procedures should be interpreted with some caution. Some incomplete reporting could have resulted where followup care was carried out after reports were filed or by another physician. In addition, when comparing total rates between years, differences in forms and data processing rules may create artificial changes. In 1987, minor complaints reported by physicians among "Other Complications" were not suppressed as in previous years. These were items, such as "unexplained pain" or "hemorrhage less than or equal to 500 cc."

Rounding

Rates are rounded to the nearest tenth. When the rate or percent is less than one-tenth, the entry is 0. Where whole numbers are used, a blank indicates none or zero.

Appendix C

Conversion of Birth Weight in Grams to Pounds and Ounces

Gramweight	Pounds and Ounces
1,000 grams and under	2 lbs. 3 oz. and less
1,001 - 1,500	2 lbs. 4 oz 3 lbs. 4 oz.
1,501 - 2,000	3 lbs. 5 oz 4 lbs. 6 oz.
