

Abortion Medical Procedures - Washington State Occurrences¹ 2001-2022

Medical abortion is a procedure that uses prescribed medications like mifepristone and misoprostol to terminate a pregnancy. A medical abortion does not require surgery or anesthesia. It can be started in a medical office or at home with follow-up visits to a health care provider. Medical abortions are approved for use early in pregnancy. They are safe with a low rate of complications. In 2022, 62% of abortions occurring in WA were medical abortions. Since their inception in 2000, less than 3% of medical procedures done in WA had complications. The rate of complications has not changed over time. The figures below describe the increasing trend in medical abortions occurring in WA 2001-2022.
